EATON

Powering Business Worldwide

Eaton Online Catalog – find product details quickly and efficiently!

You can find comprehensive up-to-date product information at <http://ecat.moeller.net>

Lookup

You can search by keywords, product names, article numbers, technical data: The search understands everything and takes you straight to the product you're looking for.

Graphical navigation

Graphical representation of the fields of application and product groups.

Selection aids

Tailored to the typical expert's approach, this search aid helps you quickly find the product you need.

Data sheets

For every article the catalog can generate a technical data sheet, which you can convert to a PDF file for printing or saving with a single click.

Parts lists

From your search results you can create a parts list that you can then send to your Eaton sales partner as a query.

You can find comprehensive up-to-date information about Eaton's automation products and switchgear in our Online Catalog.

HTML data sheet; can be saved as PDF file.

Parts list, e.g. for queries to Eaton Sales.

Energizing a world that demands more.

Discover today's Eaton.

Powering business worldwide

As a global diversified power management company, we help customers worldwide manage the power needed for buildings, aircraft, trucks, cars, machinery and businesses.

Eaton's innovative technologies help customers manage electrical, hydraulic and mechanical power more reliably, efficiently, safely and sustainably.

Powering Business Worldwide

We deliver:

- **Electrical solutions** that use less energy, improve power reliability and make the places we live and work safer and more comfortable
- **Hydraulic and electrical solutions** that enable machines to deliver more productivity without wasting power
- **Aerospace solutions** that make aircraft lighter, safer and less costly to operate, and help airports operate more efficiently
- **Vehicle drivetrain and powertrain solutions** that deliver more power to cars, trucks and buses, while reducing fuel consumption and emissions

We provide integrated solutions that help make energy, in all its forms, more practical and accessible.

With 2012 sales of \$16.3 billion, Eaton has approximately 103,000 employees around the world and sells products in more than 175 countries.

Eaton's electrical business

Eaton is a global leader with expertise in:

- Power distribution and circuit protection
- Backup power protection
- Solutions for harsh and hazardous environments
- Lighting and security
- Structural solutions and wiring devices
- Control and automation
- Engineering services

Eaton is positioned through its global solutions to answer today's most critical electrical power management challenges. With 100 years of electrical experience behind us, we're energized by the challenge of powering up a world that demands twice as much energy as today. We're anticipating needs, engineering products, and creating solutions to energize our markets today and in the future.

We are dedicated to ensuring that reliable, efficient and safe power is available when it's needed most.

PowerXL DE1 Variable Speed Starters

The new PowerXL DE1 variable speed starter combines ease of use and maximum reliability with variable motor speeds and improved machine energy efficiency. This new category of devices is the first to close the gap between conventional motor starters and variable frequency drives and combine all the advantages in a single unit.

Performance range:

- 0.25 ... 2.2 kW (U_g : 1~ 230 V, U_2 : 3~ 230 V)
- 0.37 ... 7.5 kW (U_g : 3~ 400 V, U_2 : 3~ 400 V)

Features:

- Compact: 45-mm width
- Out-of-the-box commissioning without parameterization
- No special drives engineering skills or knowledge required
- Screwdriver parameterization can be set with an optional configuration module (DXE-EXT-SET)
- Trip-free-design ensures maximum machine availability
- Suitable for use in ambient temperatures of up to 60 °C
- International standards (CE, UL, cUL, cTick, RoHS)

Accessories:

- Plug-in configuration module
- SmartWire-DT connection
- External LED keypad
- Mains chokes
- Motor chokes
- Sine filters
- drivesConnect parameter configuration software
- Parameter Copy Stick
- External EMC filter

Applications:

- Fans, pumps
- Simple Machines
- Retrofits in machines and systems in order to replace conventional motor starters or contactors for motor control

PowerXL Variable Frequency Drives DC1 Compact Machinery Drive

The compact PowerXL DC1 variable frequency drive is particularly well-suited for use with simple pump, fan, and conveyor belt systems. It can be quickly and easily configured and commissioned, resulting in tangible savings.

Performance range:

- 0.37 ... 0.55 kW (U_0 : 1~ 115 V, U_2 : 1~ 115 V)
- 0.37 ... 1.1 kW (U_0 : 1~ 115 V, U_2 : 3~ 230 V)
- 0.37 ... 1.1 kW (U_0 : 1~ 230 V, U_2 : 1~ 230 V)
- 0.37 ... 4 kW (U_0 : 1~ 230 V, U_2 : 3~ 230 V)
- 0.37 ... 11 kW (U_0 : 3~ 230 V, U_2 : 3~ 230 V)
- 0.75 ... 22 kW (U_0 : 3~ 400 V, U_2 : 3~ 400 V)

Features:

- Fast commissioning with 14 basic parameters
- Large overload capability: 150% for 60 seconds, 175% for 2 seconds
- Ambient air temperature up to 50 °C without derating
- Sensorless Vector Control
- Control of high efficient IE4 motors
- Full Short Circuit Protection
- Integrated CANopen and Modbus RTU
- Degrees of protection IP20 and IP66
- Integrated EMC filter
- Integrated braking transistor
- Integrated PI controller
- V/F control
- Voltage boost
- DC braking
- Detachable control signal terminal strip
- International standards (CE, UL, cUL, RCM, RoHS, EAC, UkrSEPRO)

Accessories:

- SmartWire-DT connection
- I/O expansions
- External keypad
- Mains chokes
- Motor chokes
- Sine filters
- Braking resistances
- drivesConnect parameter configuration software
- External EMC filter

Applications:

- Pumps, fans
- Machines
- Coating systems
- Conveyor belts
- Filling machines
- Distributed applications (IP66)
- Single-phase motors

PowerXL Variable Frequency Drive DA1 Advanced Machinery Drive

The PowerXL DA1 variable frequency drive, designed for the machine and system building industry, is characterized by its enormous flexibility in terms of communications protocols, a function block editor (PLC) that makes it possible to configure the drive as necessary for specific applications, and a powerful vector control mode for highly dynamic applications.

Performance range:

- 0.75 ... 2.2 kW (U_g : 1~ 230 V, U_2 : 3~ 230 V)
- 0.75 ... 75 kW (U_g : 3~ 230 V, U_2 : 3~ 230 V)
- 0.75 ... 250 kW (U_g : 3~ 400 V, U_2 : 3~ 400 V)
- 0.75 ... 110 kW (U_g : 3~ 575 V, U_2 : 3~ 575 V)

Features:

- Large overload capability: 150% for 60 seconds, 200% for 4 seconds
- Integrated Modbus RTU and CANopen
- Ambient air temperature up to 50 °C without derating
- Integrated EMC filter
- Integrated braking transistor
- Various I/O expansions
- V/F control, vector SL and CL, PM motor, BLDC motor, SynRel motor
- Optional field bus connections
- Safe Torque Off (STO, SIL 2/PI d)
- Optional high-resolution OLED display
- International standards (CE, UL, cUL, RCM, RoHS, EAC, UkrSEPRO, DNV (754–757))

Accessories:

- SmartWire-DT connection
- Communication modules (PROFIBUS, PROFINET, Ethernet/IP, EtherCAT, DeviceNet, etc.)
- I/O expansions
- External keypad
- Mains chokes
- Motor chokes
- Sine filters
- Braking resistances
- drivesConnect parameter configuration software
- External EMC filter

Applications:

- Winding machines
- Respooler machines
- Coating systems
- Compressors
- Mills, roller mills, shredders
- Extruders
- Cranes and lifting systems
- Marine
- Distributed applications (IP66)

PowerXL Variable Frequency Drive DG1 General Purpose Drive

PowerXL DG1 general-purpose drives are variable frequency drives in Eaton's "Next-Generation" PowerXL series. They are specifically designed for modern, sophisticated applications:

In fact, energy-saving algorithms, high short-circuit values, and a heavy-duty design all enable them to provide maximum efficiency, safety, and reliability.

Performance range:

- 0.75 ... 90 kW (U_g : 3~ 230 V, U_2 : 3~ 230 V)
- 0.75 ... 160 kW (U_g : 3~ 400 V, U_2 : 3~ 400 V)

Features:

- **Ease of use:** Startup Wizard, inControl PC Tool software, four built-in applications, diagnostics, local/remote button, removable keypad with copy/paste functionality.
- **Communicative:** Modbus RTU, Modbus TCP, Ethernet IP and BacNet MS/TP Standard on each device. In addition to that extensive I/O above the standard in this device class
- **Efficiency:** Active energy control algorithm, 5% DC choke, input surge protection, EMC filter built-in
- **Rugged and reliable:** Dual rating with high (CT) and low (VT) overload capability, conformal coated boards, brake chopper circuit, durable metal power section, 50°C rating (60°C de-rating), removable keypad rated IP54
- **Global acceptance:** UL®, CE, cUL®, RoHS, RCM

Accessories:

- Communication modules (PROFIBUS, PROFINET, DeviceNet, etc.)
- I/O expansions
- External keypad
- Motor chokes
- Sine filters
- Braking resistances
- Power Xpert inControl operating software

Applications:

- Multi-pump applications
- HVAC
- Roller and chain conveyors
- Compressors, mills
- Production machines
- Centrifuges and extruders
- Traction drives, conveyor belts
- Sawing, drilling, dosing unit drives
- Chemical and primary industries
- Water jet cutting, crushers

Information relevant for export to North America

Product Standards	UL508C, CSA-C22.2 No. 274-13; IEC/EN61800-3; IEC/EN61800-5; CE marking
UL File No.	E134360
UL Category Control No.	NMMS, NMMS7
CSA File No.	UL report applies to both US and Canada
North America Certification	UL listed, certified by UL for use in Canada
Suitable for	Branch circuits
Max. Voltage Rating	3~ 240 V AC IEC: TN-S UL/CSA: 'Y' (Solidly Grounded Wey) 3~ 500 V AC IEC: TN-S UL/CSA: 'Y' (Solidly Grounded Wey)

Accessories and Engineering

With PowerXL variable speed starters and PowerXL and 9000X variable frequency drives, you can rest assured knowing that your variable-speed power drive system (PDS) needs will be well taken care of. These units are known for their compact design and wide applicability, making them the ideal choice for most applications on the global market.

But that's not all: Additional options such as mains chokes, motor chokes, sine filters, and braking resistors make it possible not only to expand the devices' range of applications, but also to adapt to a variety of EMC environments and mains-side operating conditions.

DX-LN... mains chokes

DX-LN1...: single phase, max. 260 V, 50/60 Hz, 6 - 32 A

DX-LN3...: 3-phase max. 550 V, 50/60 Hz, 4 - 450 A

Motor choke DX-LM3...

DX-LM3...: 3-phase, max. 750 V, 0 - 400 Hz, 5 - 450 A

Radio interference suppression filter DX-EMC...

Calibrated and assigned radio interference suppression filter for Series DA1, DC1 and DL1

DX-EMC12...: single phase, with prefabricated connection cables, base-mounted filter

DX-EMC34...: 3-phase, with prefabricated connection cables, base-mounted filter, low leakage current

DX-EMC34...: 3-phase, 100 – 750 A, low leakage current

Sine filter DX-SIN3...

DX-SIN3...: 3-phase, 0 – 520 V, 0 - 150 Hz, 4 - 480 A

Sine filters used with variable frequency drives require the frequency to be set to a fixed value within a range of 4 – 8 kHz.

DX-BR... braking resistance

- with prefabricated connection cables for installation in DA1, DC1, and DL1 devices

- with 1-m long connection cable, temperature monitoring switch, 75 – 400 ohms, 0.4 – 1.6 kW

- with temperature monitoring switch, 2 – 100 Ohm, 0.2 – 102.4 kW

Engineering

Equipment code

- F = fuses and circuit-breakers
- Q = controlled switching within energy flow (contactors, circuit-breakers)
- R = limitation (reactors, resistors)
- K = radio interference suppression filters
- T = variable-frequency drives
- M = motors

AC supply system: variable-frequency drives can be connected without restriction to AC supply systems with an earthed star point (TN/TT grounding systems). Directly connecting them to and running them on unbalanced or B phase-grounded systems (e.g., USA) is not permissible.

Fuses (circuit-breakers) enable you to protect wiring and electrical devices and appliances. For personal protection, additional AC/DC sensitive residual current circuit-breakers (RCD type B) are required.

Contactors serve to engage and disengage mains voltage.

Mains chokes damp any harmonic distortion (THD) that occurs as well as current spikes and limit inrush currents (the link capacitor's charging current). In addition, they protect the mains rectifier from voltage peaks coming from the supply mains.

Radio interference suppression filters damp high-frequency electromagnetic emissions from devices and appliances. They ensure that the EMC limit values for conducted interference specified in the applicable product standards are complied with (variable-frequency drives).

Note: External radio interference suppression filters (option) permit longer motor cables and have low leakage currents. Normally, they should only be used with variable-frequency drives that do not feature an internal radio interference suppression filter. Exception: directly assigned variable-frequency drives with internal filters (calibrated combination)

Variable frequency drives permit the infinitely variable speed control of three-phase motors. To do this, the variable-frequency drive converts the voltage of the AC supply system with a constant voltage and a constant frequency to a new AC voltage with a variable amplitude and a variable frequency.

A **braking resistance** converts the generator braking energy of the variable frequency drive into heat. The variable frequency drive must be equipped with a brake chopper, which connects the braking resistance parallel to the internal DC link.

Motor chokes

- Compensate the capacitive currents,
- Reduce current ripple and the motor's current change noise,
- Attenuate the retroaction on parallel connection of several motors.

Sine filter

- Smoothen the output voltage sinusoidally,
- reduce motor noise through du/dt reduction, and thereby increase the motor insulation's lifespan,
- Reduce the leakage currents to allow better motor performance at improved EMC values.

Screened motor cables attenuate emitted and conducted high-frequency emissions within the limit values specified in the applicable product standard (EMC). They must be connected to the earth potential on both sides across a large area (PES).

A **three-phase asynchronous motor (standard motor)** converts electrical power ($P \sim U \times I$) into mechanical power ($P \sim M \times n$).

Electrical mains connection

Variable frequency drives can be connected and operated without restriction on star-point-grounded AC supply systems (according to IEC 60364).

Connecting them to and operating them on asymmetrically earthed networks, such as phase-earthed delta networks (grounded delta, USA) or non-earthed or high-resistance earthed (> 30 Ω) IT networks is permitted with limitations. In these

networks, only variable frequency drives without internal radio interference suppression filters (EMC) may be used. On devices with internal radio interference suppression, the ground connection of the filter must be disconnected.

The standardized rated operating voltages of the power supply (EVU) assure the following conditions at the transfer point to the consumer:

- maximum deviation from the rated value for the voltage (U_{LN}): $\pm 10\%$
- Maximum deviation in the voltage symmetry: $\pm 3\%$
- Maximum deviation from the rated frequency value: $\pm 4\%$

In reference to the lower voltage value ($U_{LN} - 10\%$) the supply voltage is allowed to experience a further voltage drop of up to 4% in the consumer networks.

In ring-shaped powered network systems (e.g. in the EU), the standardized consumer voltages (230 V / 400 V / 690 V) are identical to the power supply levels of the utility companies. In star networks (for example in North America/USA), the stated consumer voltages take the voltage drop from the utility company's infed point to the last consumer into account.

Table: North American voltage level

Supply voltage U_{LN} of the utility company	Motor voltage according to UL 508 C	Consumer voltage, rated value for the motors
120 V	110 - 120 V	115 V
240 V	220 - 240 V	230 V
400 V	440 - 480 V	460 V
600 V	550 - 600 V	575 V

Safety and switching

With a variable frequency drive the assignment of components on the mains side in accordance with the rated operational current at the input end I_{LN} and the utilization category AC-1. Fuses, circuit-breakers and conductor cross-sections must meet the national and regional requirements and the required approvals at the point of operation.

To prevent fires and to protect people and farm animals from unacceptably high contact voltages, residual current devices (RCD) must be used in conjunction with a three-phase variable frequency drive, only AC/DC sensitive residual current devices (RCD, Type B) can be used.

Designation of residual current device for AC/DC-sensitive RCDs: Type B:

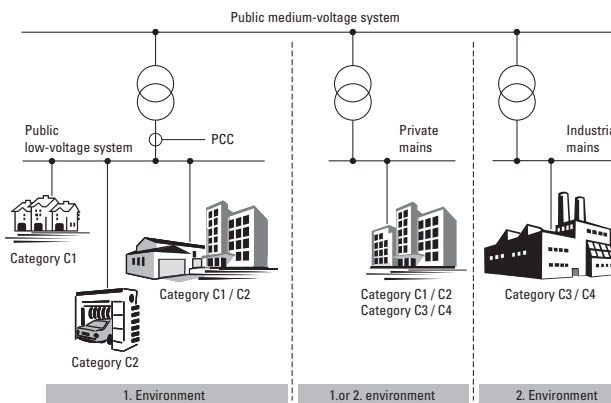

Earth leakage currents will be produced when using frequency-controlled drives due to the nature of the system. The main reasons for this consist of external capacitances between the phases of the motor cable, the motor cable's screening, star capacitors in the variable frequency drive, and radio interference suppression filters, as well as earthing measures at the motor's site of operation. These leakage currents can exceed 3.5 mA (AC) and/or greater than 10 mA (DC) can require improved PDS earthing as per EN 50178 (earth cable cross-section ≥ 10 mm (cable cross-section of earthing wire ≥ 10 mm²).

EMC compliance

Variable frequency drives work with fast electronic switches (IGBT) in the inverter. This can cause radio interference in a magnet system, which, in turn, can adversely affect nearby electronic equipment. To provide protection from these high-frequency interference sources, these should be spatially separated and screened from frequency-controlled drives.

In Europe, compliance with the EMC directive is mandatory, and is an essential requirement for CE marking. The EMC conditions for drive systems (PDS) are described in standard IEC/EN 61800-3. This product standard considers the complete magnet system from mains-side power supply right through to the motor. The Eaton variable frequency drive and speed starter with internal/external radio interference suppressor satisfy the requirements of the EMC product standard for the sensitive residential sector (first environment) and therefore also the higher limit values in the industrial sector (second environment).

Variable frequency drives

A variable frequency drive is an electronic apparatus used for the variable-speed control of three-phase motors. It is intended for installation in a machine or for assembly with other components to a machine or plant. The main components of a compact design of modern variable frequency drive are a power section ① and a control section ②.

Functional actuation of the variable frequency drive and the output parameters in the power section (e.g. frequency, voltage and current) can be adjusted through:

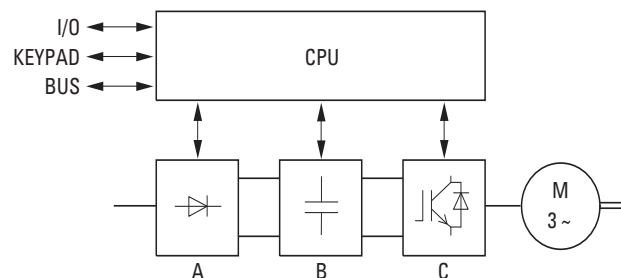

- Control signal terminals (I/O) with analog and digital (binary) inputs,
- A keypad with function keys and display units,
- Serial interfaces (BUS) with RS485 (Modbus RTU) and optional fieldbus connections (CANopen, PROFIBUS-DP etc.) and an optional PC connection.

Internal open and closed-loop control circuits monitor all variable values in the variable frequency drive and automatically switch the process off if a value reaches a dangerous level.

- ① **Power section** with:
A = Rectifier
B = DC link
C = Inverter module (IGBT)
- ② **Control section** with:
I/O = analog and binary inputs and outputs

KEYPAD = keypad with display unit

BUS = serial interfaces (RS485, fieldbus, PC interface)

U_{LN} = Phase voltage from supplying AC mains

U_{DC} = DC link voltage
 $U_{DC} = 1.41 \times U_{LN}$

Output voltage = switched DC link voltage with sinusoidal pulse width modulation (PWM)

Block diagram with main components of a variable frequency drive

Control methods

The IGBTs in the inverter of the variable frequency drive are controlled with sinusoidal pulse-width modulation (PWM). In real-life applications, the industry draws a distinction between the following control methods:

- Voltage frequency control (U/f control),
- V/Hz control with slip compensation
- Sensorless vector control (speed control)
- Vector control (closed-loop), speed control.

The **voltage-frequency control section** is the best known and most frequently used process. A simple characteristic curve (linear or quadratic) defines the motor's rotating field frequency and the corresponding three-phase line-to-line motor voltage is selected such that the motor is neither over nor under-magnetized.

The main applications of the U/f control section are:

- pump and fan drives,
- horizontal conveying and transportation systems,
- multiple motor drives (parallel operation of several motors at the variable frequency drive's output).

With the **U/f control section with slip compensation** the load-dependent speed change of individual drives can be compensated for (without sensors).

With **sensor-less vector control** the magnetic fields of rotor and stator are opposed to one another. With asynchronous motors the magnetic flux in the rotor must be mapped in an electronic model of the motor. This requires the input of the physical parameters of the rating plate on the motor.

In vector operation, the variable frequency drive can only control one motor at the output end. A parallel operation of several motors is not possible here. The exact calculation of the phase voltages at the variable frequency drive's output, however, improves the motor's operational behavior. The motor also heats up less in the lower speed range. The field-oriented vector control results in a significant improvement in the drive dynamics as well as optimizing performance; it also increases the range of possible applications. The main applications of sensorless vector control are:

- Material machining and processing equipment
- Condensers (compressor),
- Heavy starting duty (extruder, agitators, mixer),
- Lifting mechanisms and lifting gear (vertical movement, crane, lift).

With the **vector feedback control** the output current of the variable frequency drive acts serves a controlled variable. This makes it possible to perfectly adjust the three-phase motor in line with the corresponding torque boost. The motor speed can be controlled in connection with an rpm sensor (tachometer, pulse generator) (closed loop).

- ① Stator winding
- ② Air gap
- ③ transformed rotor winding

Simplified equivalent circuit diagram of a three-phase motor

Motor model

Regardless of the control method used, a variable frequency drive uses the measured voltage and current values on the stator winding (u_1 , i_1) to calculate the required manipulated variable for flux-generating component i_μ and the torque-forming magnitude in rotor i_w . The motor's load dependent slip is represented as resistor $R'2/s$. During no-load operation, this value approaches infinity ($i_w \rightarrow 0$). On the other hand, the value approaches zero as the load increases. The current in the rotor grows at this point.

Explanation:

EMC = Electromagnetic compatibility
 EVU = Utility company
 IGBT = Insulated gate bipolar transistor
 PDS = Power drives system
 RCD = Residual current device

Energy-efficient drive control technology (ErP directive)

The need for energy efficiency in a PDS and legislative specifications (EC 640/2009) has been redefined by the minimum efficiency ratings of motors. From 1 January 2017, all new motors entering service with a performance range of 0.75 to 315 kW shall not be less efficient than the IE3 efficiency level or shall meet the IE2 efficiency level and be equipped with an electronic speed control (variable frequency drive, variable speed starter). Under these conditions, the following versions of three-phase motor predominate at the present time:

- Three-phase asynchronous motor (DASM),
- Permanent magnet motor (PM),
- Synchronous reluctance motor (SynRM)

Within the same efficiency class, these three motor technologies have a comparable efficiency rating at their nominal operating point. However, there are significant differences in terms of startup behavior, in part-load operation, in respect of acquisition costs and in terms of size.

The asynchronous motor functions in accordance with the familiar principle whereby the creation of magnetic fields in stator and rotor give rise to repulsion and, in response to that, to rotational movement. This motor can be started directly off the mains supply.

PM motor are synchronous motors, i.e. there is no slip between the rotational fields of rotor and stator. The magnets assure magnetization of the rotor. That reduces losses in the rotor and increases the efficiency rating, especially at low speed. For starting and operational purposes, the PM motor needs to have a variable frequency drive (DA1).

With the SynRM motor, the rotor plates have specific cut sections. These guide the magnetic lines into the interior of the rotor and generate what is known as a reluctance torque. This results in a change of magnetic resistance and is characterized from about 11 kW by a very good efficiency rating at reduced speeds that changes under load. Here too, operation without friction and optimum speed control are only assured through the use of variable frequency drives (DA1).

In principle, all three variants operate using what is known as the U/f characteristics curve but the efficiency benefits of individual technologies are only guaranteed by feedback control algorithms adapted to suit the prevailing motor technology. With algorithms of this kind, motor operation can be optimized at every operating point, even with alternating loads.

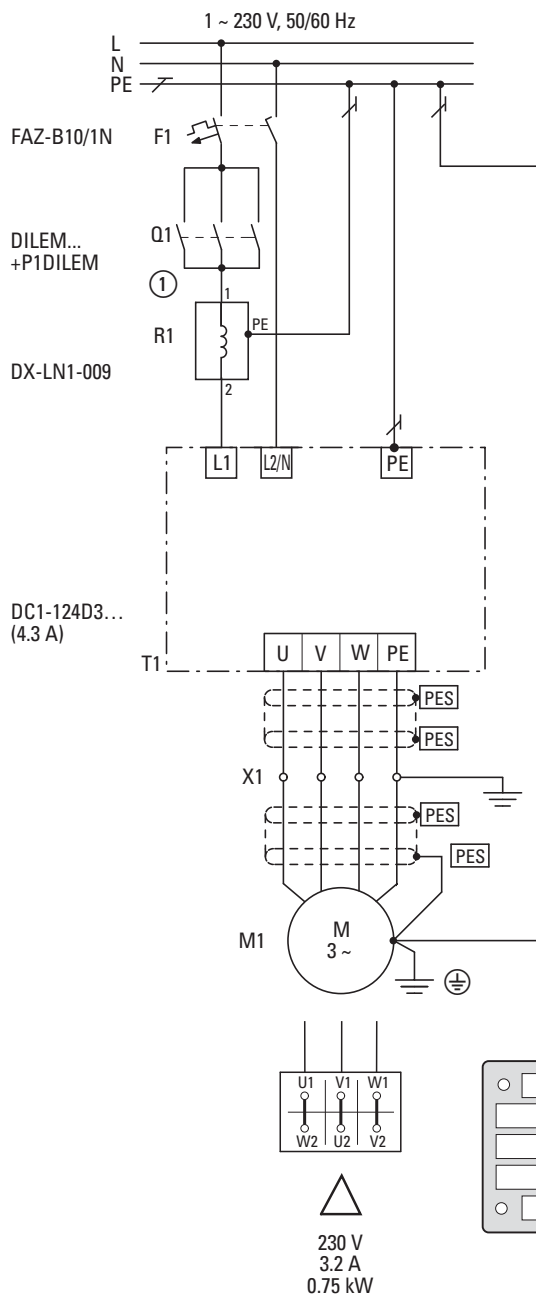

Connection example for a 0.75 kW motor

Motor: P = 0.75 kW
 Supply system: 3/N/PE 400 V 50/60 Hz
 Connection examples meeting EMC requirements: Power section (see figure below)

Variant A:

Motor connected in a „delta circuit“

DC1... variable frequency drive with single-phase supply conductors (230 V)

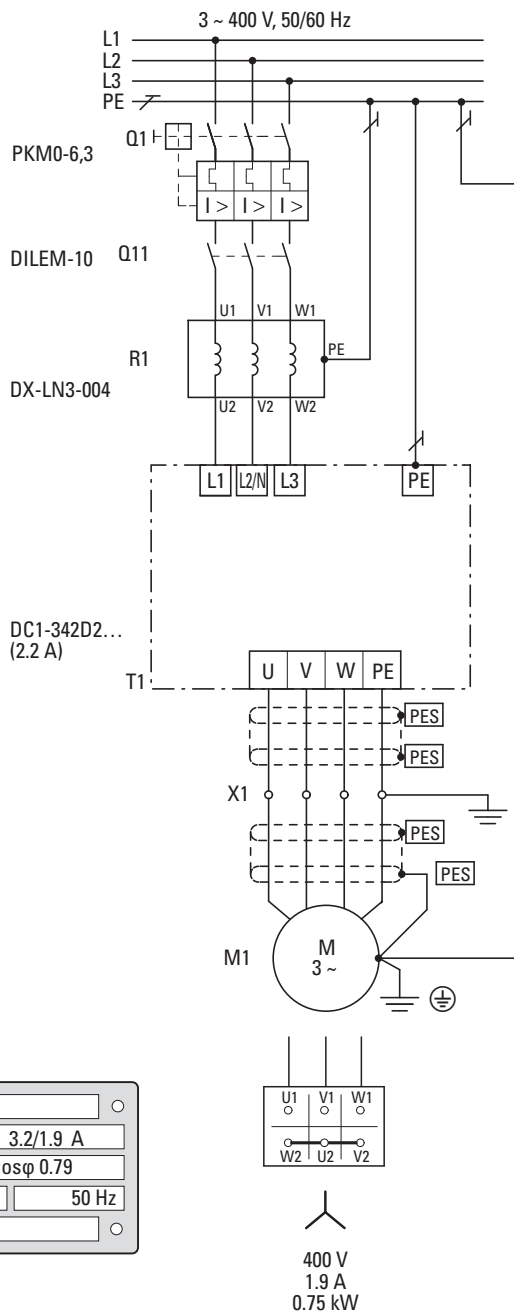

The 0.75 kW motor listed above can be connected up using a delta connection to a single-phase 230V mains supply (variant A) or in a star circuit on a 400V mains circuit (variant B).
 Taking due account of the selected mains voltage, the choice of variable frequency drive can either be 230V for 1 AC (DC1-124D3...) or 400V for 3 AC (MMX34AA2D4) and type-specific accessories.

Variant B:

Motor with 'star' circuit topology

variable frequency drive DC1... with three-phase mains supply conductors (400 V)

Notes

¹⁾ Overload cycle for 60 s every 600 s

²⁾ for normal internally and externally ventilated 4 pole, three-phase asynchronous motors with 1500 rpm⁻¹ at 50 Hz or 1800 rpm⁻¹ at 60 Hz

³⁾ Mains choke recommended only if the power quality is poor. Current harmonics (THD) are attenuated by internal DC link chokes.

⁴⁾ Use of line choke ($U_K=1-4\%$) is mandatory, if line impedance > 1 % cannot be assured

⁵⁾ Optional external radio interference suppression filter for longer motor cable lengths and for use in different EMC environments

9000X SVX, SPX variable frequency drive

9000X variable frequency drives are perfect for applications that require only the best. The SVX series of standard variable frequency drives is designed to easily meet the needs of simple and complex motor controllers in the industrial machine-building industry, while the SPX series of special-purpose variable frequency drives is ideal for sophisticated, high-performance applications. Whether run in open-loop or closed-loop mode, their vector control ensures reliable and dynamically responsive motor control for three-phase induction and PM motors.

SVX variable frequency drive

Variable frequency drives for operation with two overload profiles: 150% or 110%. The compact enclosures are available in IP21 (NEMA 1) and IP54 (NEMA 12) versions and feature an integrated radio interference suppression filter. A braking chopper is always integrated in frame sizes of up to FR6, and there are two types available.

SVX...-4A...: U_{IN} 3~400 V/ U_{OUT} 3~400 V, allocated motor outputs 0.75 – 132 kW

SVX...-5A...: U_{IN} 3~690 V/ U_{OUT} 3~690 V, allocated motor outputs 2.2 – 160 kW

SPX variable frequency drive

Variable frequency drives for operation with two overload profiles of 150% and 110%. The enclosures for these compact devices are available in versions with an IP21 (NEMA 1) or IP54 (NEMA 12) degree of protection and feature an integrated radio interference suppression filter. A braking chopper is always integrated in frame sizes of up to FR6, and there are two types available.

SPX...-4A...: U_{IN} 3~400 V/ U_{OUT} 3~400 V, allocated motor outputs 0.75 – 1200 kW

SPX...-5A...: U_{IN} 3~690 V/ U_{OUT} 3~690 V, allocated motor outputs 2.2 – 2000 kW

Description

SVX variable frequency drive

SVX units are heavy-duty, all-purpose standard variable frequency drives. Featuring a variety of application settings, they can be configured to meet virtually any challenge that arises when used to control induction motors, including applications involving multiple motors or multiple pumps run in parallel. SVX variable frequency drives are suitable for all standard applications in machines, buildings, and industrial projects. One of the factors contributing to this is their sturdy design, which features integrated chokes and EMC filters and provides effective protection against interference from the grid. In addition, their sophisticated motor control design and effective protection features for both motor and variable frequency drive guarantee reliable operation.

Essential features

- Performance range:
 - 0.75 - 132 kW (U_{IN} : 3~ 400 V / U_{OUT} : 3~ 400 V)
 - 2.2 - 160 kW (U_{IN} : 3~ 690 V / U_{OUT} : 3~ 690 V)
- High load capacity:
 - H = 2x rated operational current (2 seconds/20 seconds) and 150% overload (60 seconds/600 seconds)
 - L = 2x rated operational current (2 seconds/20 seconds) and 110% overload (60 seconds/600 seconds)
- Ambient air temperature: -10 °C up to +50 °C without derating
- Degree of protection with compact design: IP21 (NEMA1) and IP54 (NEMA12)
- I/O expansion with plug-in modules (5 slots)
- Optional fieldbus connection (CANopen, PROFIBUS-DP, DeviceNet), LonWorks
- PID control and power factor correction (PFC) for 1 to 5 pumps
- Programmable start and application wizard for an easy parameter configuration process
- Multiple display (multi-monitoring) for monitoring up to 3 different readings at the same time
- V/Hz control with boost and slip compensation
- Dynamic open-loop and closed-loop vector control
- Internal braking chopper available in sizes of up to FR9 (compact design)

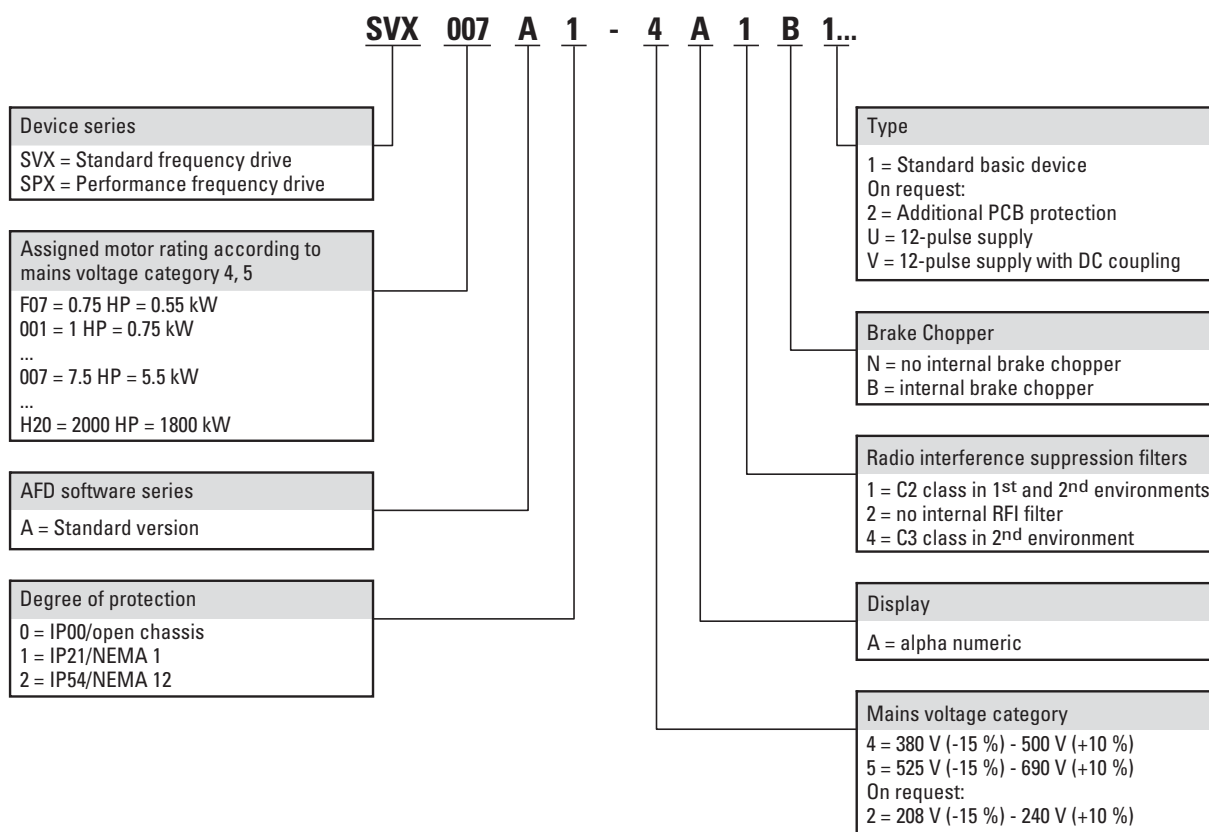

SPX variable frequency drive

SPX variable frequency drives are the perfect choice when it comes to demanding applications in which reliability, a highly dynamic response, precision, and power are a must. Popular applications include lifting equipment and conveyances (cranes, winches, elevators, lifts), compressors and oil pumps, chippers, crushers, mixers, extruders, take-up and pay-off units, and tunnel boring machines. Multi-purpose SPX variable frequency drives are designed to cover a wide variety of applications while keeping things simple. In fact, with their excellent flexibility, they make it easy to adapt to additional process requirements for custom and complex applications used to control induction and permanent magnet motors. On top of this, their sturdy design, which features integrated chokes and EMC filters, provides effective protection against interference from the grid. Finally, their sophisticated motor control design and effective protection features for both motor and variable frequency drive guarantee reliable operation.

Essential features

- Performance range:
 - 0.75 - 132 kW (U_{IN} : 3~ 400 V / U_{OUT} : 3~ 400 V)
 - 2.2 - 160 kW (U_{IN} : 3~ 690 V / U_{OUT} : 3~ 690 V)
- Expanded performance range with distributed design (IP00). Please enquire:
 - up to 1100 kW (U_{IN} : 3~ 400 V / U_{OUT} : 3~ 400 V)
 - up to 2000 kW (U_{IN} : 3~ 690 V / U_{OUT} : 3~ 690 V)
- High load capacity:
 - H = 2x rated operational current (2 seconds/20 seconds) and 150% overload (60 seconds/600 seconds)
 - L = 2x rated operational current (2 seconds/20 seconds) and 110% overload (60 seconds/600 seconds)
- Ambient air temperature: -10 °C up to +50 °C without derating
- Degree of protection with compact design: Up to 132/160 kW: IP21 (NEMA1) and IP54 (NEMA12)
- I/O expansion with plug-in modules (5 slots)
- Optional fieldbus connection (CANopen, PROFIBUS-DP, DeviceNet), LonWorks
- PID control and power factor correction (PFC)
- Direct and parallel circuit solutions, even for PM motors with high outputs
- Programmable start and application wizard for an easy parameter configuration process
- Multiple display (multi-monitoring) for monitoring up to 3 different readings at the same time
- V/Hz control with boost and slip compensation
- Dynamic open-loop and closed-loop vector control
- Internal braking chopper available in sizes up to FR9

Notes

¹⁾ Mains choke recommended only if the power quality is poor. Current harmonics (THD) are attenuated by internal DC link chokes.

Soft Starter DS7 of System xStart – Soft at the Start, High on Torque

Soft starters have become a well-established alternative to the star-delta starter. This is where the DS7, featuring two-phase control and designed to work seamlessly with DILM and PKZ switchgear, comes in. The DS7 can be flexibly combined with other units and adds the ability to "start motors softly" to the switching, protection, and starting functions common to control panels. A patented method ensures that motor run-ups will be exceptionally soft while providing a higher torque than other available solutions. Longer service intervals and reduced operating costs are welcome side effects of this.

Designed for normal applications such as pumps, fans and small conveyors, the compact DS7 is ideal. The DS7 is also available with a SmartWire-DT connection to simplify wiring and enhance functionality as an automation solution.

DS7

Description

Application

The DS7 series soft starters are two-phased controlled soft starters used for soft starting three-phase AC motors for applications with a normal operating frequency and a performance range of 3 to 200 A (1.1 to 110 kW with a 400 V mains voltage).

Closing transients and DC components during startup are effectively suppressed and guarantee even motor starting.

The special actuation method (asymmetrical trigger phase control) for the soft starter function avoids the DC components (Eaton patent) that would normally occur in two-phase-controlled soft starters. This suppresses the generation of an elliptical rotating field, which would cause uneven motor starting and increase the motor's acceleration. The true run behavior of the DS7 is therefore comparable with that of a three-phase controlled soft starter.

Functions

Typical fields of application for Series DS7 soft starters are:

- Pump drives: pressure surges are prevented through soft starting. The mechanical load on the whole plant is reduced and its service life increases.
- Fan drives: soft starting keeps fan belts from slipping, preventing premature wear. This lowers operating costs and extends the system's lifespan.
- Conveyor belts: conveyor belts start running smoothly, instead of starting with a jolt. This ensures that any goods being conveyed do not topple over. Mechanical damage to the belt itself is avoided, making it more durable.

Features

- The ramp time can be adjusted by potentiometer within a range of 1 to 30 s (for starting) or 0 to 30 s (for stopping) with a potentiometer
- The start voltage (or start torque) can be adjusted within a range of 30 to 100 percent of the mains voltage with a potentiometer
- Significant reduction in switch-on current, achieved with a short soft start ramp time (min. 1 s) for lamp and heating loads
- Internal bypass relay: switches on automatically after the end of the ramp, bypassing the internal thyristors.
- This makes it possible to comply with radio interference level B without any additional measures.
- The motor's thermal load is smaller than it would be without asymmetric ignition control.
- Designed specifically for long cables

Documentation

Surface mounting and standard mounting procedures are described in the corresponding mounting instructions and in the manual.

Instructional leaflets:
 IL03902003Z: for size 1 devices (up to 12 A motor output)
 IL03902004Z: for size 2 devices (up to 32 A motor output)
 IL03902005Z: for size 3, 4 devices (up to 200 A motor output)

Manual:
 MN03901001Z

You can download the documentation for the DS7 soft starters from the Internet at: www.moeller.net/support

Communication interface SmartWire-DT

Our SmartWire-DT interface completely eliminates the need for conventional control wiring. This has several advantages:

- No incorrect wiring
- Faster wiring
- Cost saving

The interface can be used to send control commands to the DS7-SWD and change and diagnose its parameter configuration; in addition, the control electronics can be powered via the SmartWire-DT cable. The device is controlled with one of three selectable profiles:

- A "start/stop" profile, which should already be familiar from the PKE motor-protective circuit-breaker and contactor combination
- An 8 bit-wide profile for the soft starter, which is provided the same way for the variable frequency drive and features more options
- A control profile comparable to a PROFIdrive profile, just like the one available for the variable frequency drive.

Regardless of the profile chosen, the DS7-SWD's parameters can be read and written to at any time by using acyclic services.

DS7-SWD makes it possible to read and write to all device parameters. The mechanisms of the parameter channel that is described for the drives in the PROFIdrive profile are used for this purpose. This profile provides a standardized parameter access method for variable frequency drives and soft starters.

It is also possible to overwrite the potentiometer settings on the DS7-SWD, which can come in handy, for instance, when a change made to the machine needs to be undone.

The DS7-SWD comes with a detailed diagnostic system with options that extend far beyond those of wired devices. In addition to having an error log, the DS7-SWD can detect and report nine different device faults. A warning parameter reports any present alarm messages. Moreover, the response to each individual fault can be customized. Finally, there are 35 additional messages for communication errors. Using the DS7 in connection with the PKE opens up new functionalities that were previously thought impossible to implement with a low-cost soft starter and that were reserved to significantly more expensive devices. Combining a PKE unit and a DS7-SWD makes it possible to completely protect the DS7-SWD device against overloads. In addition, it provides a current limiting function and can report thermal capacity utilization levels to higher level controllers.

Expanded temperature range

DS7-340SX...-L soft starters can operate at temperatures as low as -40 °C.

Engineering

Generalized phase control of motor voltage

By means of generalized phase control, the soft starter adjusts the grid's voltage (U_{LN}) smoothly from an adjustable start value to 100 % of the rated value U_{LN} .

U_{LN} : Mains supply voltage

U-Start: start voltage

t-Start: Ramp time of the voltage change at start

TOR (Top of Ramp): Signals the end of the set "t-Start" ramp time (output voltage U_2 = Mains supply voltage U_{LN}). The internal bypass contacts are closed after this.

This voltage control enables the inrush current of a three-phase asynchronous motor to be limited and its starting torque to be reduced. This enables a smooth and jerk-free increase in torque, adjusted in line with the machine's load behavior. This has a positive effect on the lifespan, operating behavior, and operating processes of the mechanical equipment and prevents negative effects such as:

- Impacting of cog edges in the gearbox
- Pressure surge in pipe systems (water impact),
- Slipping of V belts or
- Jitter with conveyor systems.

In DS7 and S801+/S811+ series soft starters, generalized phase control is achieved with anti-parallel thyristors that are bypassed for continuous operation by using bypass contacts (TOR = Top Of Ramp) after the time for a time-triggered voltage change (t-Start) has elapsed. The transition resistance of these bypass contacts is considerably lower than the transition resistance of the power semiconductors. This reduces the heat dissipation in the soft starter and extends the lifespan of the power semiconductors.

As well as the time-controlled startup of a motor, the soft starter also enables a time-controlled reduction of the motor voltage and thus a controlled stopping of the motor.

The output voltage of a soft starter determines the torque of the motor ($M \sim U^2$). Because of this, it is necessary to make sure that, when a machine starts up, the selected U-Start start voltage is not too low and the t-Start ramp time for the linear voltage change is set to be as short as possible.

Please note:

- Long ramp times (t-Start) will produce a soft startup behavior, but will also result in a higher thermal load on the thyristors
- A high start voltage (U-Start) will produce a higher torque and a high starting current
- Set the lowest possible start voltage and the shortest possible start ramps.

The following pages include application and setting configuration examples for DS7 soft starters.

If controlled deceleration is required, t-Stop must be set to a longer time than would be necessary for the machine to coast freely based on the load. For the thyristors, the controlled deceleration constitutes a load comparable to that produced during startup. If, for example, the deceleration ramp is activated on a soft starter with a maximum of 10 permissible starts per hour, the number of permissible starts will be reduced to five per hour (plus five stops within that hour).

Selection criteria

Soft starters ③ are selected based on the supply voltage of the corresponding grid ① (ULN) and the rated operational current of the assigned motor ②. The motor's circuit configuration (Δ/Y) must be selected in such a way that it matches the supply voltage. In addition, the soft starter's rated operational current (I_e) must be at least equal to that of the motor.

Additional selection criteria include:

- Ambient air temperature (rated value +40 °C)
- The number of starts per hour (< 10 starts, take stops into account)
- Load torque (quadratic, linear)
- Starting torque

Centrifugal pumps, centrifugal fans, simple and smooth-running conveyor belts and traction drives, and circular saws and ribbon saws are some of the typical applications for which soft starters are used. Reciprocating compressors, mixers, mills, crushers, and lifting gear are instead categorized as heavy starting duty machines. In this case, the soft starter must be oversized in terms of its overload capacity.

In the case of applications that are typical for a soft starter, such as water pumps (centrifugal pumps), and that feature comparable operational data (operating frequency, run-up time, and/or inrush currents) a soft starter can be assigned directly to the motor on the basis of the rated operational current.

Example:

- 15 kW Pump motor
- 400 V
- Rated operational current 29 A
- About three times the starting current (I_{LRP} = 87 A),
- A maximum of 10 starts per hour
- 5-second start-up time
- ambient air temperature 40 °C.

=> DS7-34...032... (I_e = 32 A)

When different operating frequencies, run-up times and/or starting currents are involved, the thermal capacity of the DS7 soft starter must be taken into account in the design. This can be done by using the following diagrams and by calculating the I²t values. These I²t values define the corresponding load capacity and overload cycle and are defined in product standard IEC/EN 60947-4-2.

DS7-34...SX032... soft starter:

- 32A: AC-53a: 3-5: 75-10
- Rated operational current (I_e) 32 A
- Load cycle AC-53a
- 300% overcurrent for 5 seconds
- 75% duty factor with 10 starts per hour

The resulting I²t value is: (3 x 32 A)² x 5 s = 46.080 A²s

The maximum I²t value of the connected motor load must be smaller:

(3 x 29 A)² x 5 s = 37.845 A²s

Soft starter DS7-34...SX032... is the right choice for this application.

If the motor had a higher inrush current, e.g., 5 times the starting current, a more powerful soft starter would have to be selected:

- Motor inrush current: I_{LRP} = 5 x 29 = 145 A, I²t value = (5 x 29 A)² x 5 s = 105.125 A²s
- DS7-34...SX041...: 41A:
AC-53a: 3-5: 75-10
=> (3 x 41 A)² x 5 s = 75.645 A²s

Soft starter DS7-34...SX041... cannot meet the required startup and load conditions required in this case.

DS7-34...SX055...:

55A: AC-53a: 3-5: 75-10

=> (3 x 55 A)² x 5 s = 136.125 A²s

Soft starter DS7-34...SX055..., however, does meet the required startup and load conditions.

Note: As the following diagram shows, the DS7-34...SX055... unit can handle even more demanding startup and load requirements, e.g., up to 20 starts per hour and longer start-up times (up to 10 seconds).

Notes

¹⁾ Rated operational current based on the load cycle specified here.

²⁾ Used to specify the circuit-breaker required for the specified load cycle. At different duty cycles (operating frequency, overcurrent, overcurrent time, duty factor), this value changes and must then be adapted accordingly.

³⁾ An external overload relay is required if the main contacts should not be disconnected in the event of an overload and a controlled soft stop is desired instead.

⁴⁾ A mains contactor is not required. Disconnection characteristics in accordance with VDE can only be ensured with the specified circuit-breaker.

⁵⁾ The superfast semiconductor fuses protect the soft starter from short circuits on the motor side. This can not, however, prevent damage caused by voltage peaks, for example through lightning strike.

S801+/S811+ Soft Starters – a Powerful Presence in a Small Design

The unparalleled performance and features behind S801+ and S811+ soft starters build upon the proven capabilities of our soft starter series. With only five frame sizes and rated operational currents of 37 A to 850 A for supply voltages of 200 V to 690 V, S801+ and S811+ units are some of the world's smallest compact soft starters.

These three-phase-controlled soft starters, which feature an internal bypass and comprehensive monitoring and protection mechanisms, provide a soft start and ensure that three-phase motors can remain in continuous operation safely and reliably even in applications with large load torques.

S801+ soft starters are designed with standard applications in mind and make a strong case with their ease of use, while S811+ devices feature a digital control and display unit that provides access to advanced functions for sophisticated applications. In addition, S811+ units can be used not only in a standard line (outside the delta) configuration, but also with an inside-the-delta configuration.

Description

The soft starters in series S801+ assure reliable operation even under tough and challenging ambient conditions. This series makes a compelling case as a result of its ease of use and is the perfect choice for standard applications such as pumps, fans, compressors, and conveyor belts.

S801+ soft starters have three-phase control and are equipped with internal bypass contacts for continuous operation. With their comprehensive protection and monitoring functions, S801+ soft starters ensure a soft startup, as well as safe and reliable continuous operation, for three-phase motors with rated operational currents of 11 A to 850 A when working with mains voltages of 200 V to 600 V. For example, when used in pump applications, they prevent water impact by using controlled deceleration (soft stop control) and torque monitoring, significantly reducing the mechanical loads exerted on pump systems in the process.

Essential features S801+ / S811+

- Rated operational current: 37 - 850 A
- Parameterizable overload settings: 31–100%
- Adjustable overload classes: class 5, 10, 20, 30
- Base setting: 15 s start ramp, 4 starts per hour, 300% starting current at 40 °C ambient temperature
- Allocated motor outputs for in-line connection:
 - 7.5 - 250 kW (3~ 230 V)
 - 18.5 - 450 kW (3~ 400 V)
- Ambient air temperature: -30 °C to +50 °C
- any required mounting position
- Degree of protection with compact design (IP20 optional)
- 5 compact designs
- Adjustable torque control
- Adjustable kick start
- Efficient use of power achieved with internal bypass contacts during continuous operation
- 24-V control voltage:
 - External supply required
 - 1 A continuous current
 - 10 A Inrush current (peak value for 150 ms)

S801+ specific characteristics

- Microswitches and potentiometers make it easy to configure these soft starters

S811+ series soft starters provide all the features and characteristics of S801+ soft starters, plus expanded functionality and an operating unit (DIM = digital interface module).

With the S811+, motors can be connected using the standard line configuration or using the delta circuit (inside-the-delta configuration / six-wire connection). Using an inside-the-delta configuration will reduce the current flowing through the soft starter by approximately 42%. This way, a 58 A soft starter can be used to start and run a motor with a rated operational current of 100 A, for example.

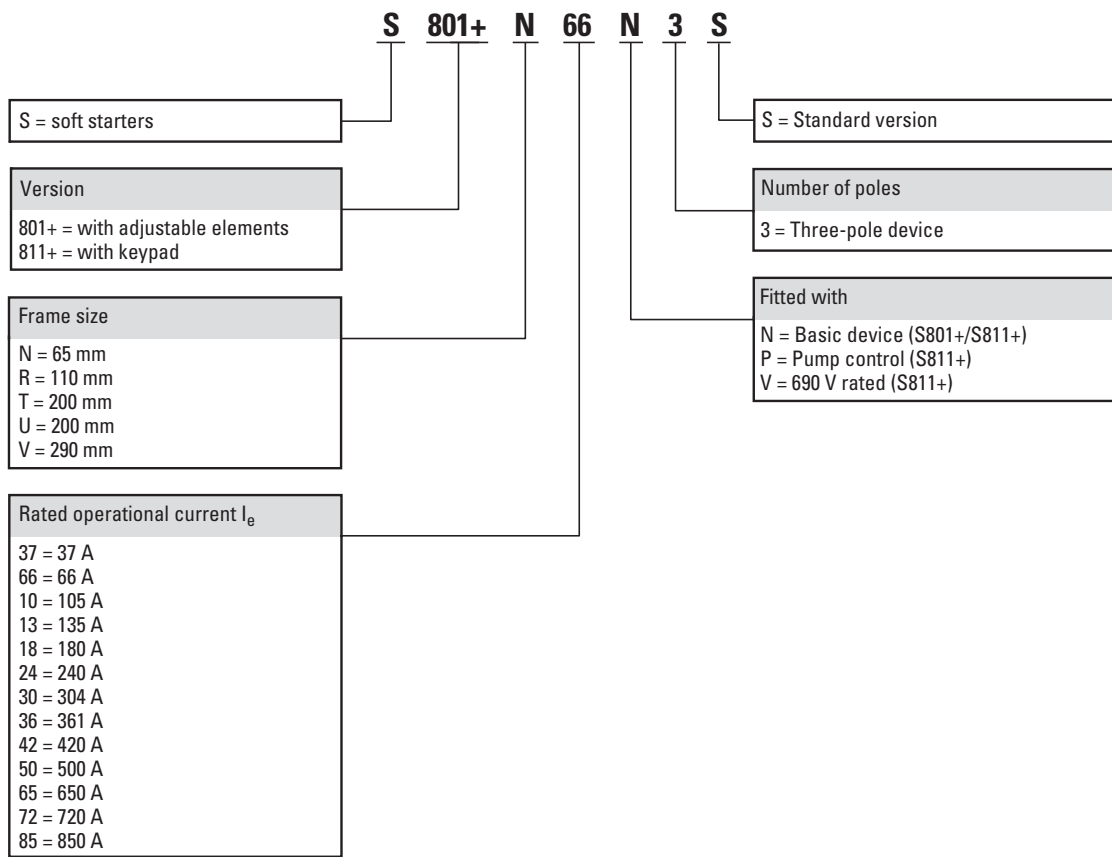

Important operating unit characteristics (S811+)

- Language-neutral LCD display with backlight
- Easy to use and configure with function keys
- System parameter configuration
- Diagnostic and monitoring options
- Reading display (e.g., L1, L2, L3 phase currents)
- Error Display
- Offset placement (mounted on door), connection via plug-in patch cord with RJ11 plug
- Front IP54

S811+ specific characteristics

- Mains voltage up to 690 V
- Allocated motor outputs for in-line connection:
 - 7.5 - 250 kW (3~ 230 V)
 - 18.5 - 450 kW (3~ 400 V)
 - 160 - 710 kW (3~ 690 V)
- Special pump control algorithm with prolonged soft stop ramp
- In-delta connection, see "Engineering, connecting examples"
- RS485 Modbus Connection
- EtherNet-IP/Modbus-TCP with option C441 (communication adapter).

Distributed Drive System Rapid Link 4.0

Standardized installation procedures, the ability to directly and locally configure parameters with a plug and play configuration, and networked communications – these are the needs of material handling system applications today when it comes to state-of-the-art drive engineering and the systems it produces.

Eaton delivers a modern answer with the Rapid Link 4.0 distributed drive system. With its flexible power spectrum, its simple handling and its intelligent programming options, this new motor starter and variable frequency drives generation is the first choice for all kinds of conveying engineering applications.

RAMO electronic motor starters

Electronic DOL and reversing starters with a lifespan of more than 10 million operations, degree of protection IP65

Rated operational current, adjustable between 0.3 – 6.6 A when using a three-phase mains connection with 400 V – 480 V, for rated motor outputs of up to 3.0 kW (400 V) / 3 HP (460 V)

RAMO-D...: DOL starter

RAMO-W...: reversing starter

RASP speed controllers

Frequency-controlled motor starters with Volts-per-Hertz control (V/Hz control) and slip compensation or vector control, as well as an integrated radio interference suppression filter (EMC); IP65 degree of protection.

RASP-2...: Rated operational current of 0.48 – 2.4 A with three-phase mains connection of 400 V – 480 V, allocated motor output of up to 0.75 kW (400 V) / 1 HP (460 V)

RASP-3...: Rated operational current of 0.66 – 3.3 A with three-phase mains connection of 400 V – 480 V, allocated motor output of up to 1.1 kW (400 V) / 1.5 HP (460 V)

RASP-4...: Rated operational current of 0.86 – 4.3 A with three-phase mains connection of 400 V – 480 V, allocated motor output of up to 1.5 kW (400 V) / 2 HP (460 V)

RASP-5...: Rated operational current of 1.12 – 5.6 A with three-phase mains connection of 400 V – 480 V, allocated motor output of up to 2.2 kW (400 V) / 3 HP (460 V)

Rapid Link 4.0 is a modern, efficient drive and PLC. It is the competent further development of the Rapid Link 2.1/3.0 device series, suitable for simple and complex tasks in all aspects of material handling. For example in airports, industrial production and logistics centers. The Rapid Link system consists of the RAMO electronic motor starters and the RASP frequency controlled motor starters.

The RAMO and RASP motor starters are designed with IP65 protection and can be installed in direct proximity to the drive. Their versions and mounting depend on the required specifications and the local conditions. The RAMO and RASP are connected with standard plug connectors to the energy and databus systems predominantly used in material handling systems (AS-Interface). Connection can be implemented without interrupting the required location. This simplifies installation and reduces the wiring requirement.

Overview of features

RAMO 4.0 electronic motor starters

Application and function

The RAMO motor starters enable the electronic DOL or reversing starting of three-phase motors in automatic or manual mode. The electronic overload protection for motor ratings from 90 W to 3 kW at 400 V (50/60 Hz) is configured with DIP switches. Full motor protection is ensured when used in connection with temperature sensors.

The operating mode is set via the AUTO - OFF/RESET – MANUAL key switch and can be combined with the 'Quick stop' and 'Interlocked manual operation' via the two sensor inputs (M12 sockets). Operating states are diagnosed and error messages (Reset) acknowledged on the device or via the AS-Interface. RAMO is available in different versions:

- with actuator output (24 V DC) for a direct actuation of external switching devices, e.g. solenoid valves.
- with electronic actuation for mechanical motor brakes.
- with lockable repair switch for diagnostic and maintenance work, making it possible to safely de-energize the device locally.

Essential features

- Standard size in square enclosure. The bottom section with the two power terminals (power plug, motor feeder socket) and the repair and maintenance switch can be turned 90° clockwise and counterclockwise.
- Long lifespan up to 10 million switching operations and up to 3,000 switch cycles per hour at 2.2 kV.
- Rated operational current 6.6 A.
- Operating and ambient temperature from -10 to +55 °C, without derating.
- Monitoring of thermistor and motor cable.
- Maximum motor cable length: 10 m.

Frequency controlled motor starter RASP 4.0

Application and function

The RASP motor starter enables the infinitely variable speed control of three-phase motors in the range from zero to 320 Hz. The standard size for 400 V (50/60 Hz) is assigned four motor ratings: 0.75 kW, 1.1 kW, 1.5 kW and 2.2 kW. Full motor protection is ensured by the adjustable current limitation (I²t controller).

The operating mode is set via the AUTO - OFF/RESET – MANUAL key switch and can be combined with the 'Quick stop' and 'Interlocked manual operation' via the two sensor inputs (M12 sockets). Settable fixed frequencies and cyclical program sequences extend the application range and relieve the load on the higher-level head-end controller (PLC). Operating states are diagnosed and error messages (Reset) acknowledged on the device or via the AS-Interface. A hand-held programmer and a PC interface are available for the parameterization of the variable frequency drive module.

RASP is available in different versions:

- with integrated brake chopper with braking resistance for dynamic braking.
- with electronic actuation for mechanical motor brakes.
- with lockable repair switch for diagnostic and maintenance work, making it possible to safely de-energize the device locally.

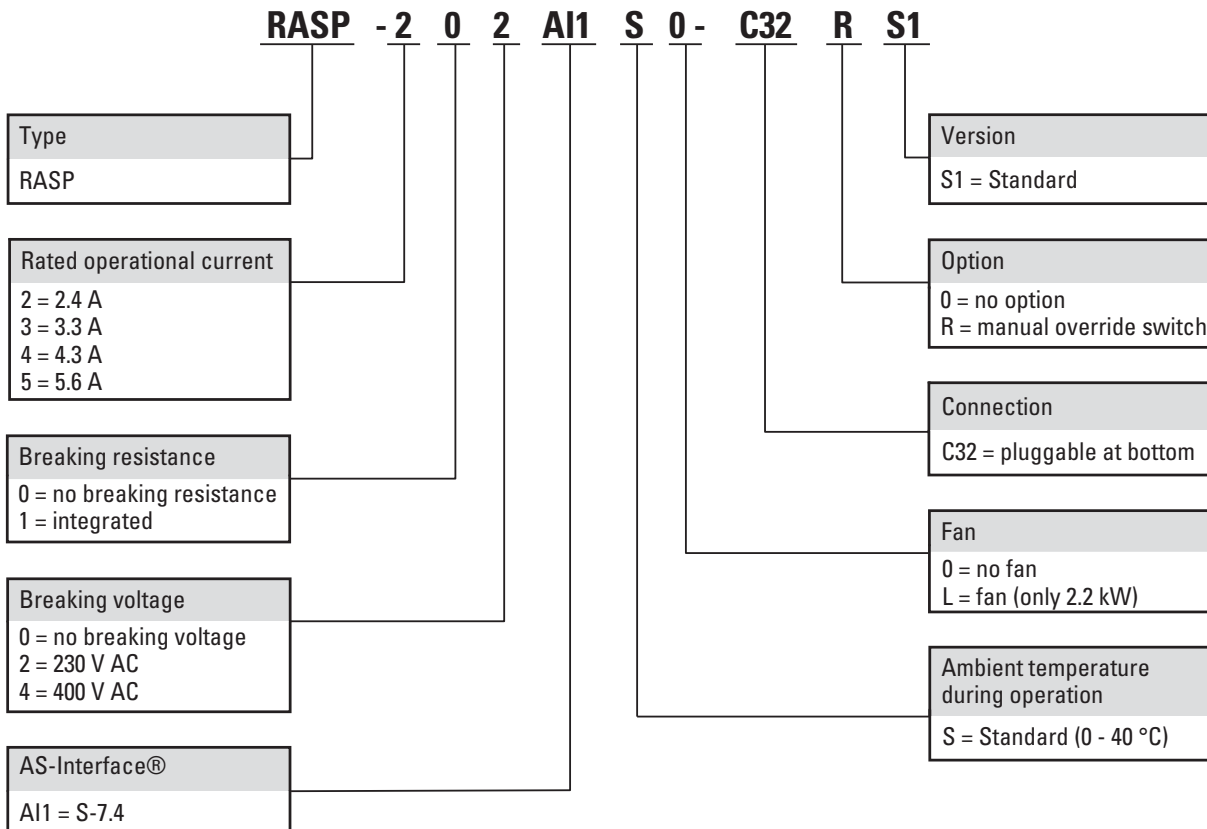

Essential features

- Standard size in square enclosure. The bottom section with the two power terminals (power plug, motor feeder socket) and the repair and maintenance switch can be turned 90° clockwise and counterclockwise.
- Monitoring of thermistor and motor cable.
- Operating and ambient temperatures from 0 to +40 °C without derating, with optional fan in the performance range up to 1.5 kW max. +55 °C.
- Rated operational current: 2.4 A, 3.3 A, 4.3 A, 5.6 A
- EMC class C3 in 2nd environment
- Maximum motor cable length: 10 m shielded.

Instructions

- 1) Rated operational current at an operating frequency of 6 kHz and an ambient air temperature of +40 °C
- 2) for normal internally and externally ventilated 4 pole, three-phase asynchronous motors with 1500 rpm⁻¹ at 50 Hz or 1800 min⁻¹ at 60 Hz
- 3) at 400 V, 50 Hz
at 440 - 480 V, 60 Hz
- 4) for actuation of motors with mechanical brake
- 5) integrated brake chopper with braking resistance for dynamic braking

Description	For use with	Part no. Article no.	Price see price list	Std. pack	Instructions
Power supply at flat cable RA-C1					
Flexible busbar junction 400 V AC/24 V DC Connection socket for power connection cable					
 Insulation piercing terminals, terminal socket with lock mechanism	RA-C1-7X4HF RA-C3/C1-1,5HF	RA-C1-PLF 290188		5 off	-
Protection cover for protecting the 400 V AC/24 V DC flexible busbar junction					
 -	RA-C1-PLF	RA-C1-COV 254693		10 off	-
Plug connector for 400 V AC/24 V DC flexible busbar junction					
 Plug insert with hood	RA-C1-PLF	RA-C1-VP-PLM 231574		5 off	Order cable gland V-M25 separately.
Distributor module for feeding the 400-V-AC/24-V-DC of the ribbon cable with a round cable					
 Termination with piercing screws, 2 x V-M25 and 2 x V-M20 knockout plates, connection module with spring-loaded terminals, connection of round cables up to 4 mm ² .	RA-C1-7X4HF	RA-C1-AM-7 290214		6 off	Order cable gland V-M25 or V-M20 separately.
Power/AS-Interface connection cable for connecting the device with the 400 V AC AS-Interface flexible busbar junction					
 Double cable with outgoer plug (flexible busbar end) and M12 plug and power plug (device end)	RAMO RASP RA-C1-PLF1	RA-C1-PLM/C3-1M5 112624		1 off	Can be used when AS-Interface implemented in flat cable.
400 V AC/AS-Interface flexible busbar junction Connection socket for power/AS-Interface cable					
 Insulation piercing terminals, terminal socket with lock mechanism	RA-C1-7X4HF RA-C1-PLM/ C3-1M5	RA-C1-PLF1 116904		1 off	Can be used when AS-Interface implemented in flat cable.
Power/AS-Interface connection cable For connecting the device with 400 V AC/24 V DC/AS-Interface flexible busbar					
 Double cable with connection module (flexible busbar end) and M12 plug as well as power plug (device end), termination with piercing screws, knockouts Length 1.5 m	RAMO RASP RA-C1-7X4HF	RA-C1-AM/C3-1M5 112625		1 off	Can be used when AS-Interface implemented in flat cable.
Distributor module for the 400V AC feeding to the ribbon cable with a round cable					
 With 3 flexible busbar inputs and 2 round cable inputs Connection of round cables 4 mm ²	RA-C1-7X4HF	RA-C1-VM-7 264244		2 off	Order V-M25/V-M20 cable gland and RA-C1-DF bushing separately.
Flexible busbar bushing for bushing for flat cable in distributor module or control cabinet					
 -	RA-C1-VM-7	RA-C1-DF 264243		10 off	-
Distributor module 24 V DC control voltage is taken from the ribbon cable					
 Termination with piercing screws, connection sockets with screw contacts	RA-C1-7X4HF	RA-C1-VP-AM-2 264315		5 off	Order cable gland V-M20 separately
Flexible busbars for fastening the ribbon cable					
 -	RA-C1-7X4HF	RA-C1-FIX 272086		100 off	One set with 100 clips.

Description	Length m	For use with	Part no. Article no.	Price see price list	Std. pack	Instructions
Power supply at flat cable RA-C1						
End-piece for terminating the ribbon cable						
	-	RA-C1-7X4HF	RA-C1-END1 290189		10 off	-
Tools						
	For cutting flat cable	RA-C1-7X4HF	RA-C1-CUT 254690		1 off	-
	for removing casing at the ends of the flat cable	RA-C1-7X4HF	RA-C1-AZ-4 272087		1 off	A standard engineer's pliers is required.
Power supply at round cable RA-C2						
Power connection cable for connecting the device with the round cable junction						
	with power plug and plug for round cable junction, halogen-free, 5 x 1.5 mm ²	1.5	RAMO RASP RA-C2-S1-4	RA-C3/C2-1,5HF 290211	1 off	-
Round cable junction Connection socket for power connection cable						
	for 7 x 2.5/4 mm ² , 400 V AC and 24 V DC, termination with insulation piercing technology, cable fixing with metal screws, pre-wired socket insert, suitable for cable outer diameters 10 - 13 mm.		RA-C3/C2-1,5HF	RA-C2-S1-4 257830	1 off	Equipment supplied: 1 pairs of gaskets for these cable diameters, 1 lock mechanism.
Blanking plug for closing the last round cable junction in the power line						
	-	RA-C2-S1-4	RA-C2-SBL 265357		10 off	One set with 10 blanking plugs.
Power supply at round cable RA-C4						
Round cable junction Connection socket for power cables from 2.5 - 6 mm²						
	T junction via spring-cage terminal, 1.5 to 6 mm ² and/or plug connection of 0.5 - 4 mm ² , Enclosure IP65		RA-C4-PPB/ C3-1M5 RA-C4-X/ C3-1M5	RA-C4-PB65 116905	1 off	Enclosure opening gaskets are not included as standard
Gasket Slotted enclosure bushing seal						
	for Ø 11 - 13 mm EPDM round cable, silicon free and halogen free, IP65		RA-C4-PB65	RA-C4-D13 116907	10 off	-

Spare keys						
for AUTO - OFF/RESET - HAND key-switches 		RAM0 RASP	M22-ES-MS1 216416		5 off	-

The Rapid Link 4.0 electronic drive system enables remote and flexible installation in the direct proximity of the drive unit. The entire system is designed with protection to IP65. All electrical connections (mains voltage, motor feeder, sensors) are implemented simply with the standard connectors that are primarily used in materials handling applications.

- ① Sensor (light barriers)
- ② RAMO
- ③ Motor connection cable
- ④ Mains connection on power bus
- ⑤ AS-Interface

Motor starter selection

All motor starters (RAMO, RASP) can provide electronic motor protection and the additional connection of temperature sensors (thermistor, ThermoClick, PTC). The motor starters are available in the following variants, with or without a lockable repair switch (mains transfer switch):

- RAMO-D, electronic DOL starter for one operating direction.
- RAMO-W, electronic reversing starter (two operating directions).
- RASP, frequency-controlled motor starter with several speeds for two operating direction in assigned ratings.

Electrical mains connection

The motor starters can be connected to and operated on 400 V three-phase, star point-earthed AC supply systems (in accordance with IEC 60364) without any restriction. The neutral conductor must be connected for motor starter variants that actuate a 230 V motor brake.

Safety and protective device

The power bus must have short-circuit protection. The length of the power bus depends on the upstream group protection. Calculations for design examples are provided in the Rapid Link manual (MN03406003Z):

- PKZM0-25 motor-protective circuit-breaker, max. approx. 40 m.
- FAZ C25/3 miniature circuit-breaker, max. approx. 60 m.
- PKE32/XTU-32 system protective circuit-breaker, 50 m to 220 m.

The group protective devices listed here protect:

- the power bus from overloads and short-circuits.
- the spur lines to the motor starter (RAMO, RASP) from overloads and short-circuits.
- the motor feeder of the RAMO

On the RASP frequency-controlled motor starter, the motor feeder is protected by the internal variable frequency drive.

When using residual current devices, a Type B AC/DC sensitive residual current circuit-breaker must be used with the RASP frequency-controlled motor starter.

EMC compliance

All motor starters observe the required EMC limit values when connected as specified. The RASP frequency-controlled motor starter must be provided with a shielded motor cable (RASP-CM1-...) and installed with the specified EMC measures. The internal RFI filter then allows operation in accordance with category C3 in the second environment.

Terminal Models

The electrical connection in the power section (mains voltage, motor feeder) is implemented with plug-in terminals in the base.

- ① 5-pole power connector for connecting the 3 AC 400 V mains voltage, (N), PE.
- ② 8-pole motor feeder socket as per DESINA specification.

By rotating the base 90 degrees, connection is also possible from the right or left. This makes it possible to keep the operating and connection area and the heat sink on the RASP in the preferred vertical position.

Example RASP:

Connection from below (standard)

Connection from the right (90 degree rotation of the base to the left)

Three installation systems are available for connecting the power plug to the mains:

RA-C1, flat cable system

RA-C2, round cable system with plug connectors

RA-C4, round cable system with contact connectors

Device variants with a repair switch (RAMO-...-C32R..., RASP-...-C32R...) ensure that the drive can be isolated locally from the power supply for repair or maintenance work, even when it is still connected. A padlock can be used to secure the repair switch.

The 8-pole motor feeder can be used to connect:

- a three-phase AC motor (U1, V1, W1, PE),
- a motor brake (B1, B2) with a control voltage of 230 V AC or 400 V AC,
- a thermistor or temperature switch (ThermoClick). These connection cables (T1, T2) can at the same time be used to monitor the motor cable and the connection of the motor feeder plug.

Example: Motor feeder with shielded motor cable on the RASP

Control level

The control level features a selector switch (key switch) for selecting automatic mode and manual mode locally. The RAMO-W and RASP motor starters are also provided with a selector switch for reversing the motor direction in manual mode.

The automatic mode and the control voltage power supply are implemented via the AS-Interface. All connections in the control level (AS-i, sensors etc.) are implemented with M12 plug connectors. For this the M12 connectors just have to be fitted on [1] and rotated to secure them [2] (see illustration below).

The sensor inputs (I3, I4) enable the Rapid Link motor starters to execute sensor-controlled functions immediately and independently of PLC and bus cycle times:

- Interlocked manual operation,
- Quick Stop,
- Rotation direction change (on RAMO-W and RASP),
- Controlled speeds (only RASP)

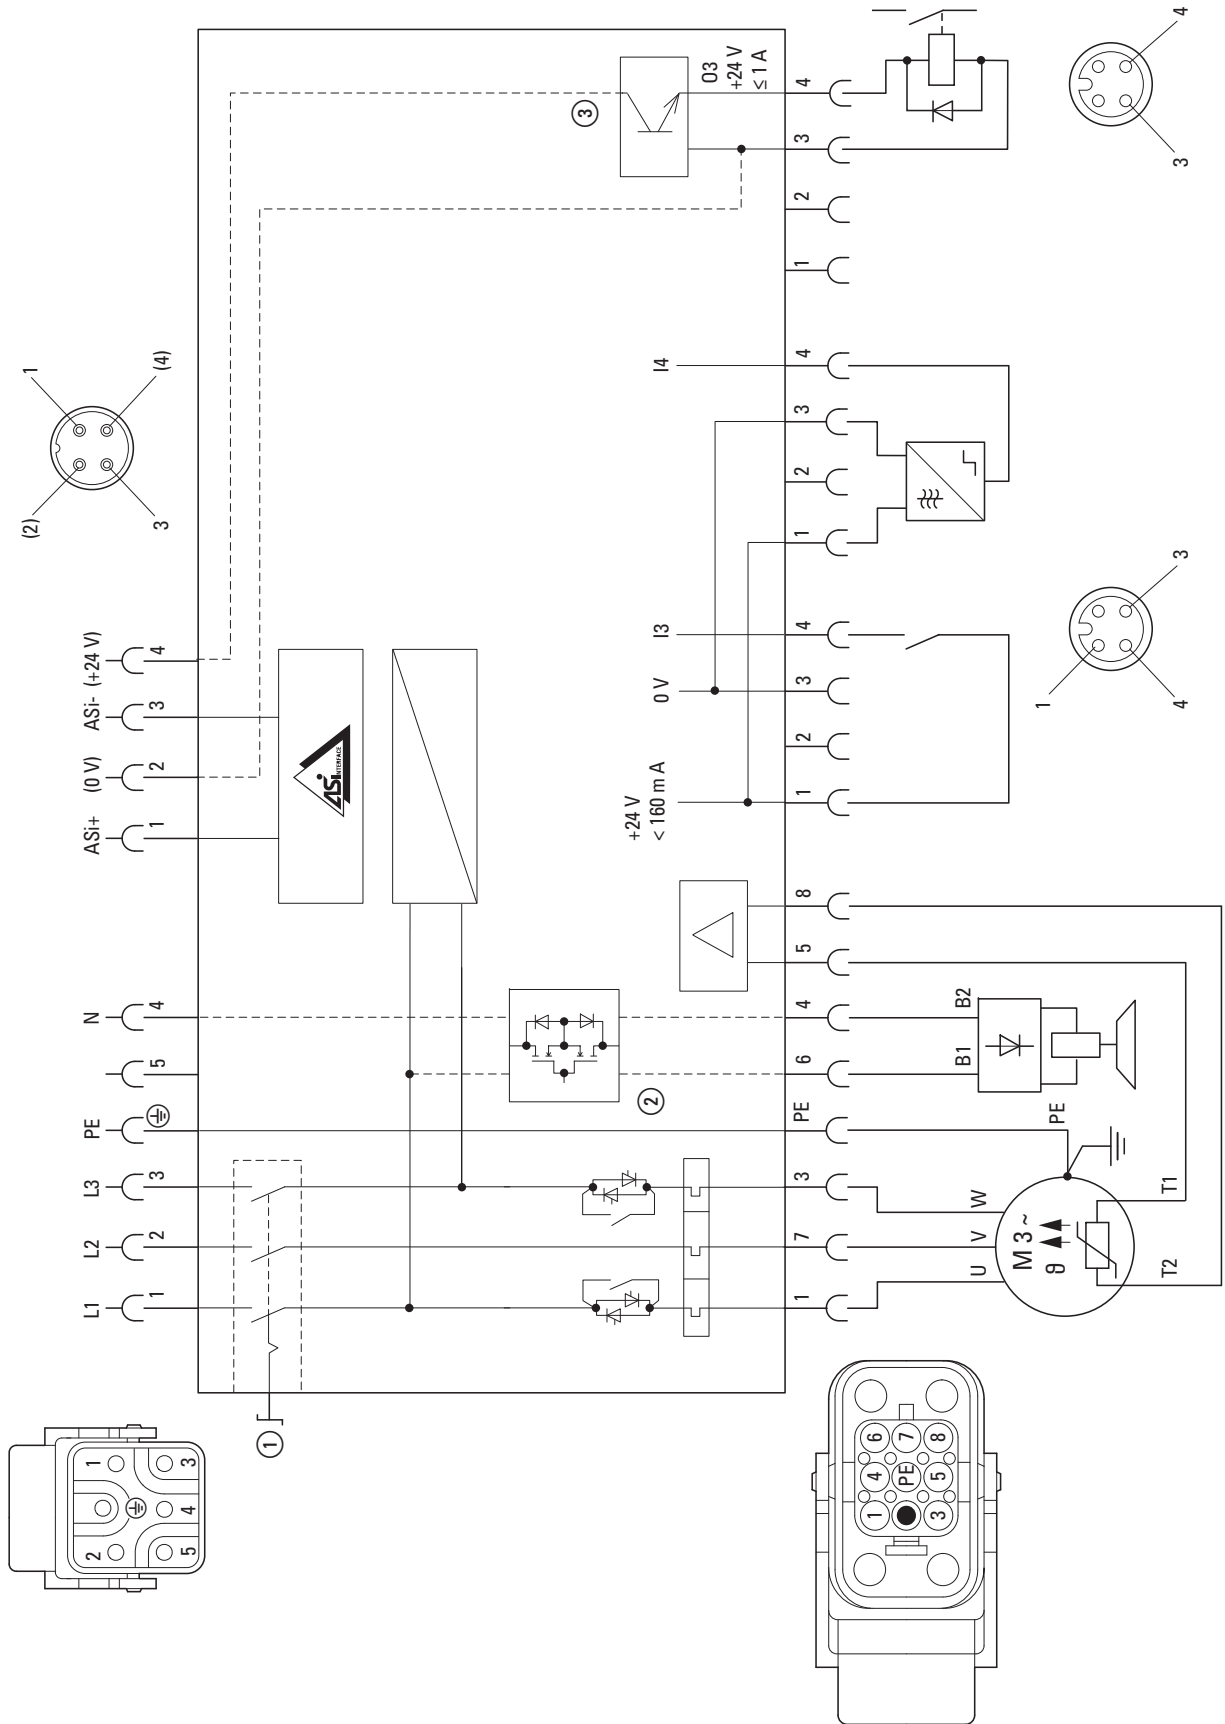

On the RAMO-DA... and RAMO-WA... a 24 V DC output (max. 1 A, O3) also makes it possible to control external actuators (valves, couplings, indicator lights) directly.

The functions are selected directly on the motor starter via microswitches. On the RASP additional settings (variable frequency drives) can be made from a hand-held terminal or from the parameter software.

Engineering

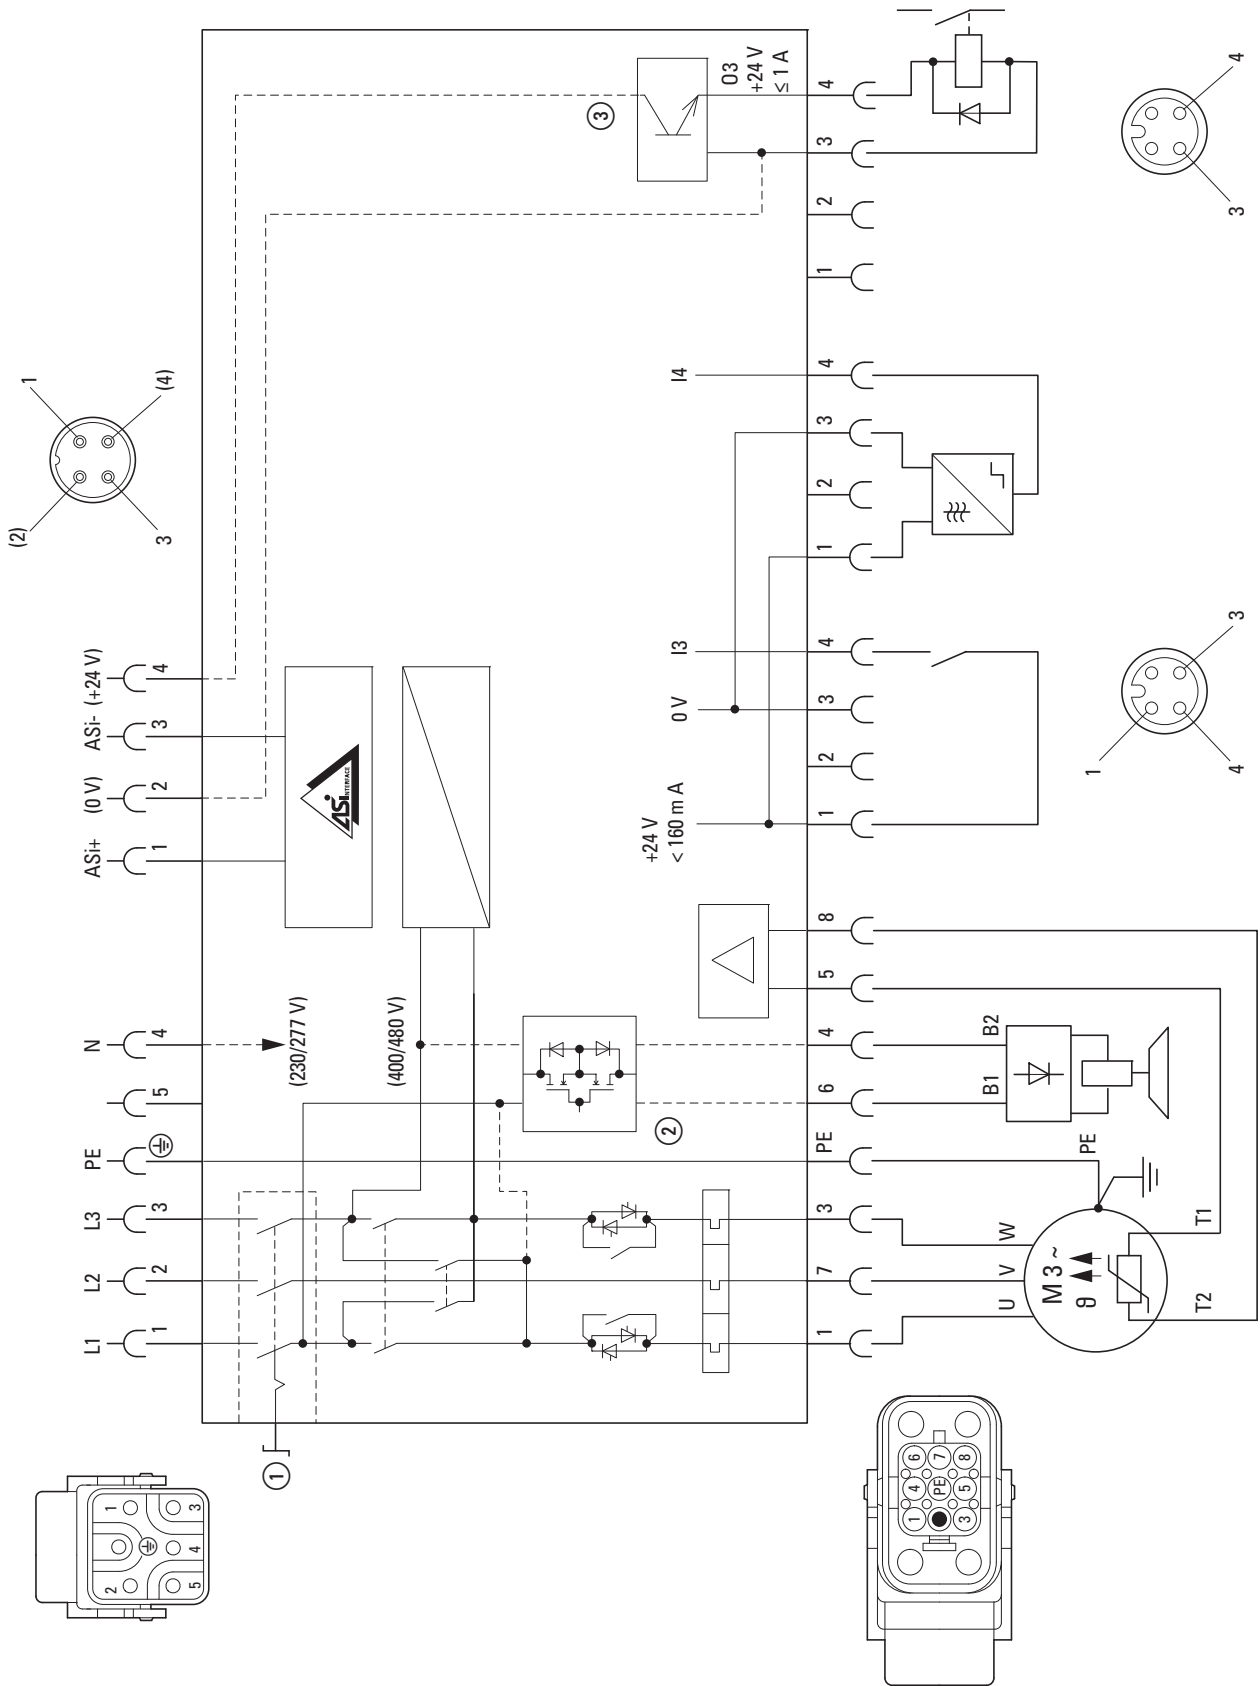

Block diagram DOL starter RAMO-D

Optional versions:

- ① Repair and maintenance switch RAMO-D...-C32R...
- ② Activation of external brake: 230/277 V at RAMO-Dx2... or 400/480 V at RAMO-Dx4...
- ③ actuator output, RAMO-DA...

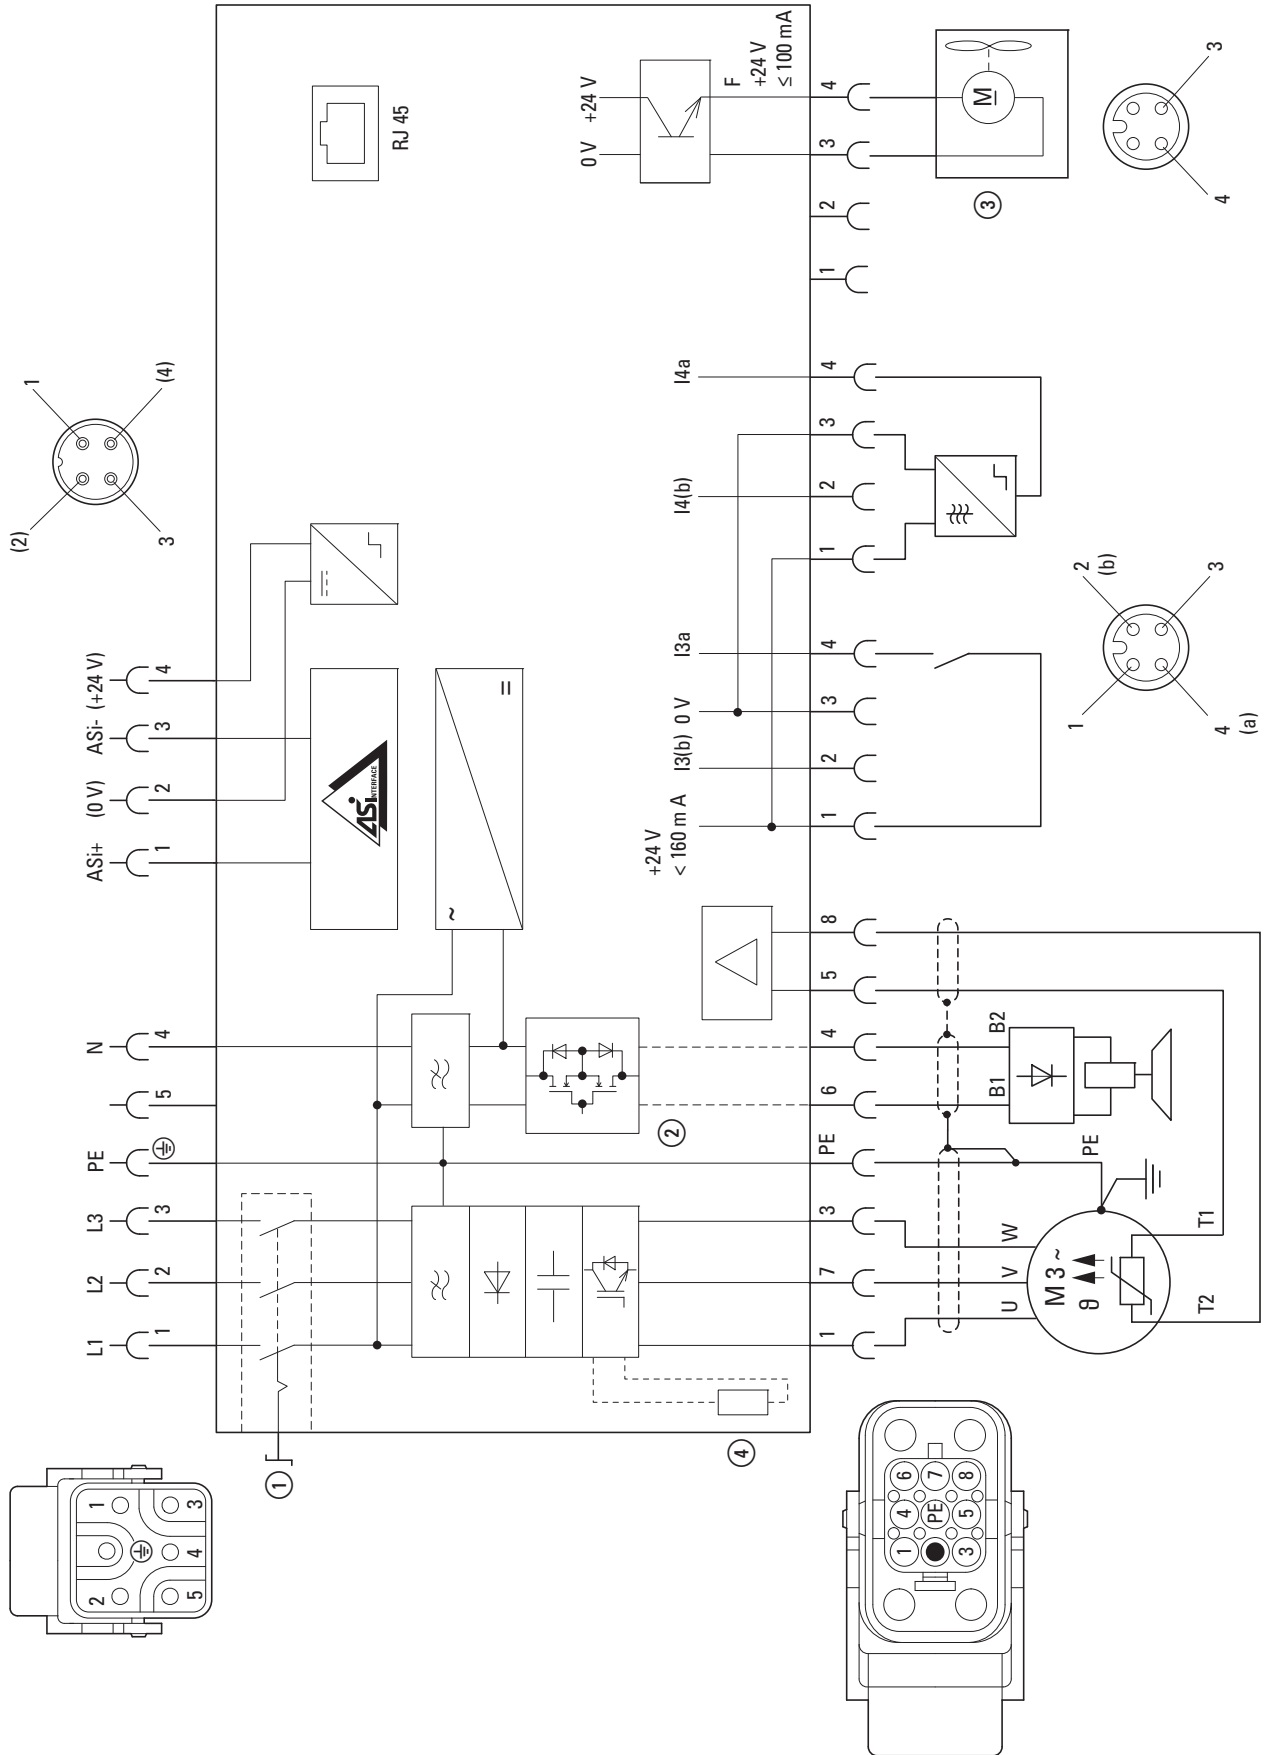

Block diagram RAMO-W reversing starter

Optional versions:

- ① Repair and maintenance switch RAMO-W...-C32R...
- ② Actuation of external brake: 230/277 V on RAMO-Dx2... or 400/480 V on RAMO-Dx4...
- ③ actuator output, RAMO-WA...

Block diagram RASP with 230V brake

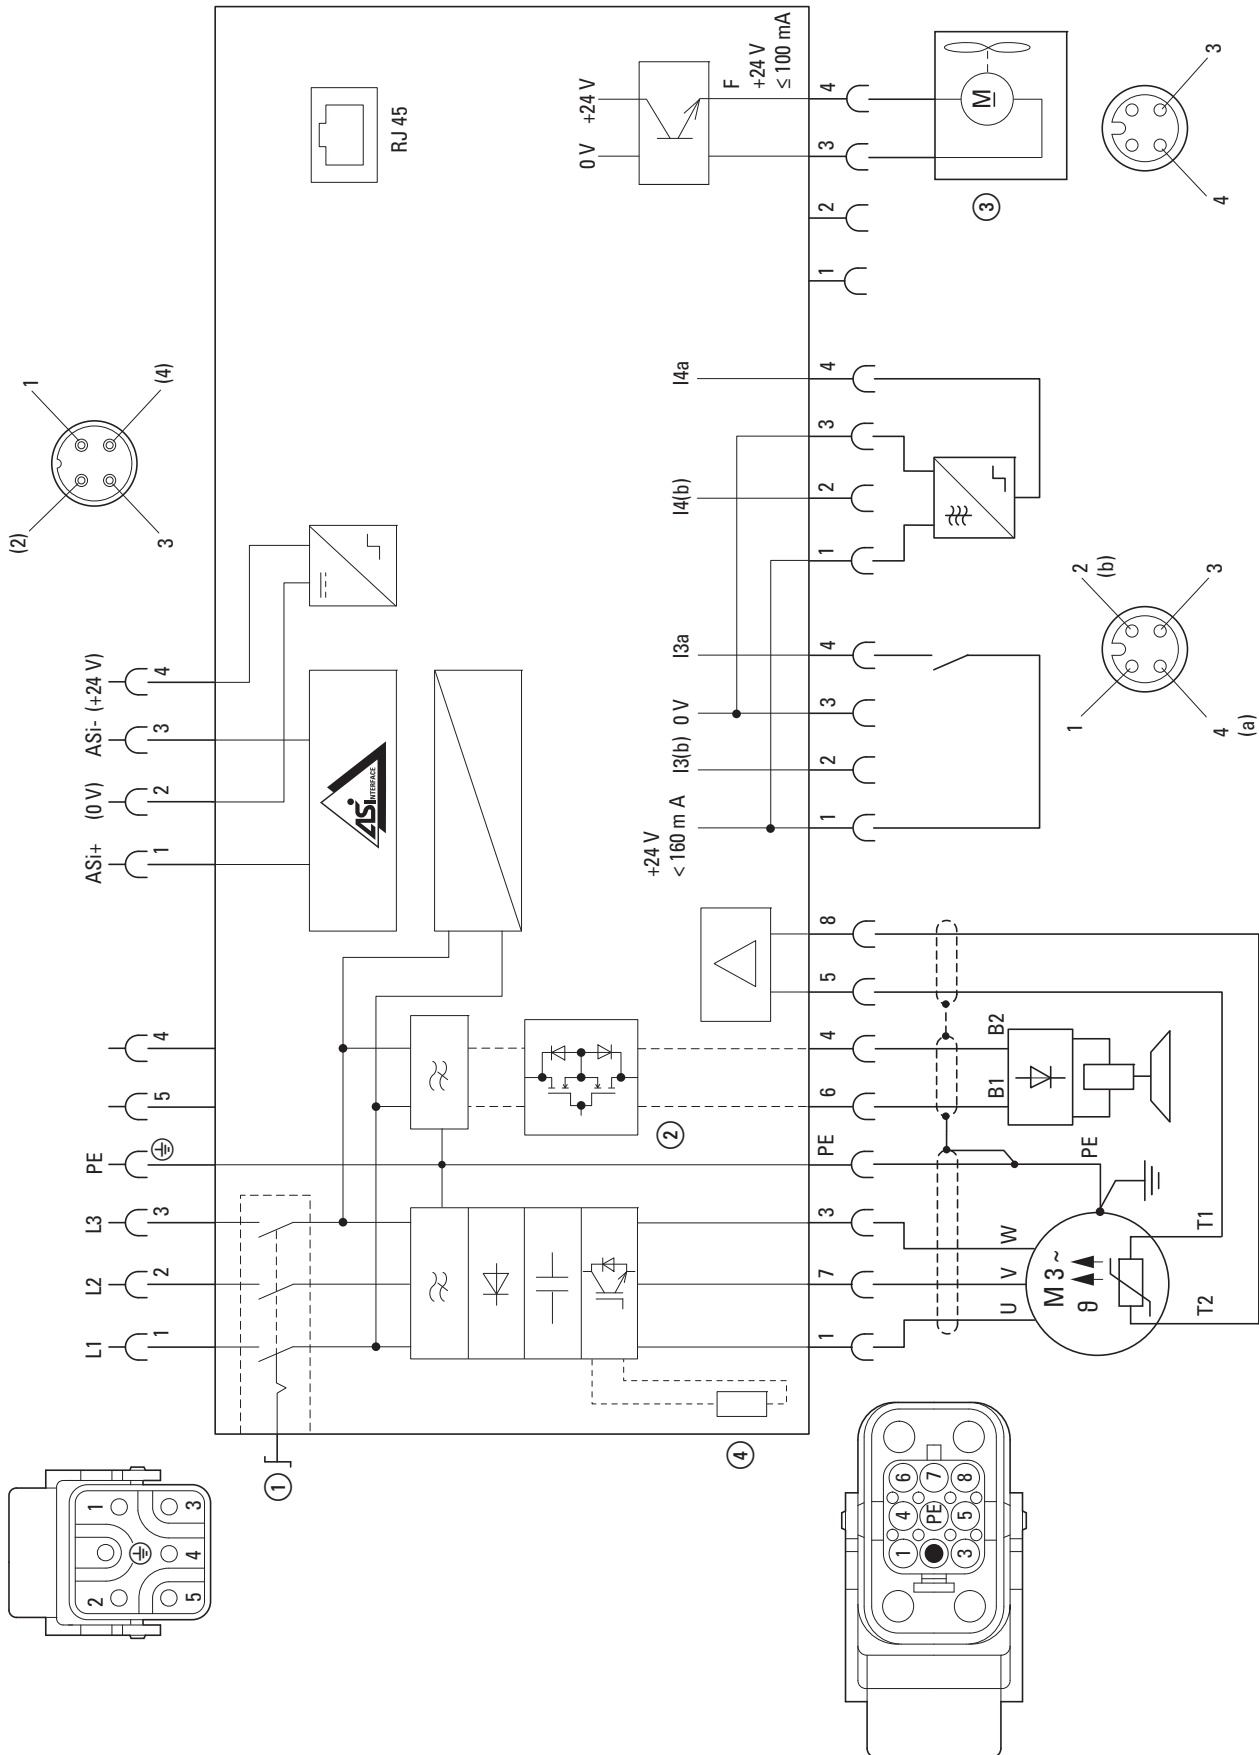

Optional versions:

- ① Repair and maintenance switch, RASP-...C32R...
- ② Activation of external brake (230 V), RASP-...xx2...
- ③ Device fan, RASP-...L-C32...
- ④ internal braking resistance, RASP-x1...

Notes:

Y connector RA-XM12-Y is required in order to connect 4 sensors (I3a, I3b/I4a, I4b) (→ accessory)

Block diagram RASP with 400V brake

Optional versions:

- ① Repair and maintenance switches, RASP-...C32R...
- ② Activation of external brake (400 V), RASP-...xx4...
- ③ Device fan, RASP-...L-C32...
- ④ internal braking resistance, RASP-x1...

Notes:

Y connector RA-XM12-Y is required in order to connect 4 sensors (I3a, I3b/I4a, I4b) (→ accessory)

SmartWire-DT – Cost-optimized Communication for Switchgear

Manufacturers of machines and systems strive to achieve a balance between the maximum level of functionality and cost optimization. SmartWire-DT is a communication system for industrial switchgear based on the concept of continued development in the control panel and peripherals: from control through to protection and switching, and extending to driving, operation and monitoring. One technology from which you will profit, now and in the future.

Drives and soft starters – communicate with SmartWire-DT

Being able to use a controller to directly access all the parameters in soft starters, variable speed starters, and variable frequency drives via SmartWire-DT is the epitome of ease of operation. For example, this enables users to easily read and overwrite setpoints, as well as to retrieve extended status, error, and diagnostic messages directly and establish absolute data transparency. Moreover, easy-to-use SmartWire-DT plug-in units make installation fast and error-free, with the resulting connection including the control current supply for DS7 soft starters.

PowerXL DE1, DC1, and DA1 devices can be easily expanded with plug-in modules and connected to SmartWire-DT, with function blocks enabling simple communication with Eaton controllers (PLCs, HMIs). Moreover, more advanced communication is also possible based on the PROFIdrive profile and other profiles as well. This not only makes it possible to configure all drive parameters, but also provides advanced diagnostic options.

Note: You can find the entire SmartWire-DT range of products by consulting our industrial main catalog or our online catalog at <http://ecat.moeller.net>

Features

SmartWire-DT HMI-PLC

- with SmartWire-DT master interface and PLC function
- Compact design with light plastic enclosures
- Wide selection of onboard interfaces
- 3.5" , 5.7" or 7" TFT-LCD screen

SmartWire-DT Gateways

- Connection of SmartWire-DT to field bus.
- Field bus address setting with dip switches
- Automatic baud rate detection
- Feeding the supply voltage for the SmartWire-DT modules
- Supplies the control voltage for the motor starter or contactor
- Configuration button for automatic addressing of the SmartWire-DT slaves.
- Support of up to 99 SmartWire-DT modules.

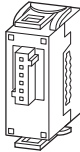

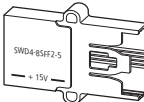

SmartWire-DT module

- Function element for connecting to RMQ-Titan pilot devices.
- Function element for connecting to DLM contactors
- Function element for connecting to PKZ/PKE motor-protective circuit-breakers
- Function module for connecting to NZM2,3,4 circuit-breakers
- Connection of digital and analog input/output modules
- DS7 Soft starter connection
- Function element for connecting to PowerXL DC1, DA1 variable frequency drives and DE1 variable speed starter

SmartWire-DT Assist (SWD-Assist)

- Easy creation of SmartWire-DT networks
- Integrated validity check
- Generation of ordering lists.
- Online-Functionality
 - Simple pre-commissioning
 - Configuration check and comparison
 - Display of parameters and diagnostics
 - easy diagnostics of SmartWire-DT slave
- Free download under: <http://downloadcenter.moeller.net>

Instructions
The rated motor currents apply to normal internally and surface-cooled three-phase motors with 1500 rpm.
DOL starting: Starting current max. 6 × rated motor current.
Starting time max. 5 s.
Y/Δ-start: Starting current max. 2 × motor rated current.
Starting time max. 15 s.
Set overload relay in line to 0.58 × motor rated current.

Fuse ratings at Y/Δ starting apply also to three-phase slipring motors.
For higher rated currents, starting currents and/or longer starting times, larger fuses will be required. Table applies for time delay and gL fuses (VDE 0636)

**For LV h.b.c. fuse with aM characteristics
the fuse should be equal to the rated operational current.**

Drives engineering selection criteria

Each drive task requires a drive motor. The speed, torque and controllability of each motor must fulfill the requirements of the task. The following generally applies: the application determines the drive. The drive motor most frequently used worldwide in industrial plants and large buildings is the 3-phase asynchronous motor. Its robust and simple construction as well as its high degrees of protection and standard types are the main features of this inexpensive electric motor.

Motor connection

When connecting a 3-phase motor to the mains supply, the data on the rating plate of the motor must correspond to the mains voltage and frequency. The standard connection is implemented via six screw terminals in the terminal box of the motor and with two types of circuit, the star connection and the delta circuit, depending on the mains voltage.

The rotation direction of a motor is always determined by directly looking at the drive shaft of the motor (from the drive end). On motors with two shaft ends, the driving end is denoted with D (= Drive), the non-driving end with N (= No drive).

Regardless of the circuit type and the type of three-phase asynchronous motor, the connections must be labeled, so that their alphabetical sequence (e.g. U1, V1, W1) corresponds with the order of the mains voltage phase sequence (L1, L2, L3) and causes the motor to rotate clockwise.

On the three-phase asynchronous motor, three windings are arranged offset from each other by 120°/p (p = number of pole pairs). To generate a rotating field in the motor, an alternating voltage is applied to each phase in turn at a time delay of 120°.

The effect of inductance causes the rotation field and torque to be formed in the rotor winding. The speed of the motor thus depends on the number of pole pairs and the frequency of the supply voltage. The operating direction can be reversed by swapping over two of the supply phases.

FWD = forward run (clockwise rotation field)
REV = reverse run (anticlockwise rotation field)

Information on the rating plate

The electrical and mechanical rating data of the motor must be stated on its rating plate (IEC 34-1, VDE 0530). The data on the rating plate describes the stationary operation of the motor in the area of its operating point (MN, e.g. at 400 V and 50 Hz). The operational data is unstable in the motor start phase. The following examples show the rating plates for two motors with a motor shaft output of 4 kW and the respective connection circuits on a 3-phase AC network with 400 V and 50 Hz.

Star circuit

230 / 400 V	Δ / Y	14.5 / 8.5 A
S1	4.0 kW	cos φ 0.82
1410 min ⁻¹		50 Hz
IP 54		Iso. KI F

$$U_{LN} = \frac{\sqrt{3}}{3} \times U_W, I_{LN} = I_W$$

- With the specified 230/400 V voltage, this motor must be connected to the 3-phase system (U_{LN} = 400 V) in a star-connected circuit.
- The voltage of each motor winding is designed for 230 V. The windings must therefore be connected in sequence to the phase voltage (400 V).
- The three winding phases (W2-U2-V2) are configured in the terminal box to the so-called star point. The voltage of the individual phases to the star point is 230 V (= U_W).

Startup characteristics

The following figure shows the characteristic startup curves of a 3-phase asynchronous motor.

- I_A: Starting current
- I_N: Rated operational current at the operating point
- M_A: Starting torque
- M_B: Accelerating torque (M_M > M_L)
- M_K: Breakdown torque
- M_L: Load torque
- M_M: Motor torque
- M_N: Rated load torque, (stable operating point, intersection point of the 3-phase speed torque characteristic with the load characteristic)
- M_S: Pull-up torque
- n: Speed (actual value)
- n_N: Rated speed at the operating point
- n_S: Synchronous speed (n_S - n_N = slip speed s)

Synchronous speed:

$$n_s = \frac{f}{p}$$

Slip speed in %:

$$s = \frac{n_s - n}{n_s} \cdot 100\%$$

Delta circuit

400 / 690 V	Δ / Y	8.5 / 4.9 A
S1	4.0 kW	cos φ 0.82
1410 min ⁻¹		50 Hz
IP 54		Iso. KI F

$$U_{LN} = U_W, I_{LN} = \frac{\sqrt{3}}{3} \times I_W$$

- With the specified 400/690 V voltage, this motor must be connected to the 3-phase system (U_{LN} = 400 V) in a delta circuit.
- Each motor winding is designed here for the maximum phase voltage of 400 V and can be connected directly.
- The three winding phases (U1 – W2, V1 – U2, W1 – V2) are combined in the terminal box and connected directly to the individual phases.

3-phase asynchronous motor speed:

$$n = \frac{f}{p} \cdot (1 - s)$$

- f: Frequency of voltage in Hz (= s⁻¹)
- n: Speed in r.p.m.
- p: Number of pole pairs
- s: Slip speed in r.p.m.

Electric power:

$$P_1 = U \times I \times \sqrt{3} \times \cos \phi$$

- P₁: Electrical power in W
- U: Rated operating voltage in V
- I: Rated operational current in A
- cos φ: Power factor

Motor output (power equation):

$$P_2 = \frac{M_N \times n}{9550}$$

- P₂: Mechanical shaft output power in kW
- M_N: Rated torque in Nm
- n: Speed in r.p.m.

Efficiency:

$$\eta = \frac{P_2}{P_1}$$

Planning safety and process optimization – CAD data at the click of a mouse!

ePLAN[®]

- 9,500 article data items and macros
- Convenient selection tool
- Version P8

Eaton is providing its customers with CAD data to offer optimum support during planning. Both electrical and mechanical design data can be called up quickly and conveniently from the Internet at any time. This reduces processing times, minimizes errors and thus reduces costs already in the engineering phase of control panels, systems and machinery.

- Models for approx. 10,000 products
- 70 different neutral & native formats

eCAD: Eaton makes product data and macros available for the EPLAN planning system and the Electric P8 version. Device data for over 9,500 products can be downloaded from the Eaton website and integrated in customer article databases using a specially developed selector.

mCAD: Eaton makes 2D and 3D data available for more than 10,000 products. Over 70 different neutral and native formats guarantee compatibility with the project engineering systems of the customer. The models can either be integrated directly into the planning software from the Partcommunity Portal on the Internet or via the CADENAS Partsolution software.

Worldwide export of machines and plants

European machine and system building and worldwide exports are closely related. Even if you don't export your machines at present, you should be prepared for it in the future. Eaton provides switchgear and protective devices with all the essential approvals and certificates for machine and system building. In most countries around the world, conformity with international standards is the sole requirement for successful exports. This is because components in these locations are governed by compliance with well known and established IEC standards. In this respect, the European CE mark is not only the passport for exports within Europe but also far beyond its borders.

World market equipment for machine building

Nearly all the switchgear and protective devices of Eaton's Moeller® series are world market devices. Each product line thus carries all the approvals and certification marks required for worldwide use.

These product lines include those for

- Pilot devices, limit switches
- Contactors and various timing and special relays
- Motor-protective circuit-breakers and relays
- Electronic components and systems.

With circuit-breakers and switch-disconnectors, Eaton offers IEC devices for use in most countries in the world and NA devices with virtually the same dimensions and the same accessories for the North American market. This considerably simplifies device selection since the North American standards often involve the need for considerably different technical specifications.

Electrical engineering products and their applications are not harmonized internationally.

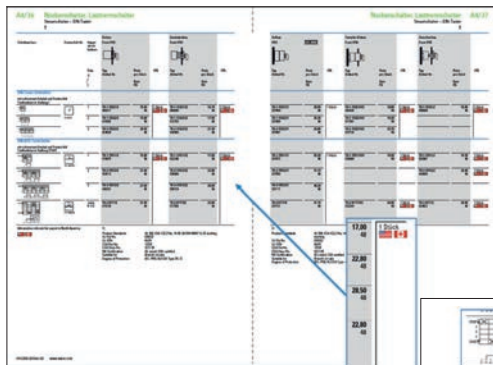

The greatest differences to the IEC world are in North America, i.e. the USA and Canada. For many newcomers to the export business, it is initially surprising to experience the very different approaches and solutions.

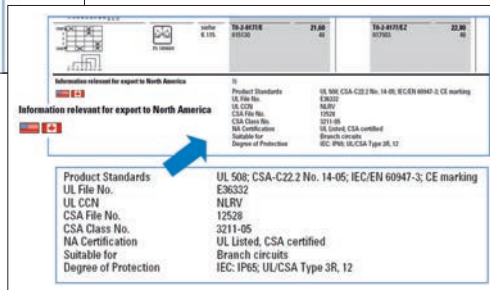

Special components, such as handles for main switches that can only be operated by the intentional switching of an

additional handle when the control panel door is opened, may sometimes be required for export to North America. Likewise, the European motor-protective circuit-breaker is only accepted with an upstream protective device or with larger air and creepage distances at the incoming terminals. Eaton is the competent partner of choice for export-related issues here.

Qualified information is a critical key to success

The Eaton Main Catalogue for Moeller® series products provides reliable information for machine and panel builders on the approval of components deployed for North American market. Each selection page provides information such as the relevant product standard, the E-File Number, the Category Control Number or the CSA Class Number. Many customers incorporate this information in their parts lists in order to be well prepared for the acceptance procedures.

Up to 13 data items are listed here for each product, such as the suitability for use in feeders or branch circuits, the maximum operating voltage, or the North American degree of protection, such as UL / CSA Type 4X. The Main Catalogue also contains a glossary with explanations of the American terms.

The link <http://applications.eaton.eu> shows the relevant approvals or permits for each component type. This therefore enables you to view the certificates provided or, depending on the test authority, also the product report. The information given is the same as what is provided in the databases of the authorities.

Anyone wishing to avoid unfortunate experiences, should make use beforehand of the large number of publications that Eaton is offering on the issue of exports to North America. They contain the implementation of the codes & standards and a description of different practices.

These technical articles can be accessed via <http://www.eaton.eu/Europe/OurCompany/News/Publications/index.htm> They can be downloaded free of charge.

To find the right contact person:

At Eaton, we believe that building and maintaining strong relationships with our customers is something that deserves our undivided attention.

This is why you can rest assured knowing that you will be able to count on us for every project from the very start. To find out whom to contact for your needs, please visit our website:

In just a few steps, we will get you the contact information for the person or team in charge of support for your specific industry in your region.

To find the right contact person anywhere in the world, visit:

→ www.eaton.eu/contact

Support and Service for UPS Systems and Hydraulic System Solutions

Building a strong relationship with you is of utmost importance to us. This is why you can count on us to quickly get your questions, requests, and suggestions to the relevant specialists. After all, your challenges are our challenges.

Questions regarding uninterrupted power supplies (UPS)?

Our **Technical Service** staff will be more than glad to assist you if you are experiencing any difficulties with an Eaton UPS, DC power supply system, or any other Power Quality product.

Our **Technical Support** staff is there to answer any questions you may have regarding our products.

To find the right contact person anywhere in the world, please visit

www.eaton.eu/contact

Questions regarding hydraulic system solutions?

Simply contact our customer service head office in Baden-Baden and our staff will be glad to put you in contact with a local contact person.

Customer Service:

MORE POSSIBILITIES.
 POWERFUL SOLUTIONS.

Powering Business Worldwide

Eaton has been serving the power management needs of our customers for more than a century. Over the years, we have expanded our expertise and portfolio of products and services by uniting some of the world's most respected names with Eaton's strong heritage of innovation.

Our goal is simple; to provide unique solutions across a wide range of markets that keep businesses on the leading edge of change. That's the power of One Eaton.

Eaton is dedicated to ensuring that reliable, efficient and safe power is available when it's needed most. With unparalleled knowledge of electrical power management across industries, experts at Eaton deliver customized, integrated solutions to solve our customers' most critical challenges.

Our focus is on delivering the right solution for the application. But, decision makers demand more than just innovative products. They turn to Eaton for an unwavering commitment to personal support that makes customer success a top priority. For more information, **visit www.eaton.eu**.

To contact an Eaton salesperson or local distributor/agent, please visit www.eaton.eu/electrical/customersupport

Changes to the products, to the information contained in this document, and to prices are reserved; so are errors and omissions. Only order confirmations and technical documentation by Eaton is binding. Photos and pictures also do not warrant a specific layout or functionality. Their use in whatever form is subject to prior approval by Eaton. The same applies to Trademarks (especially Eaton, Moeller, Cutler-Hammer). The Terms and Conditions of Eaton apply, as referenced on Eaton internet pages and Eaton order confirmations.
